in the way from one district to		
7	253	••••
Total	3 628	4,088
Total	3,628	4,088

Imissions into Jail were 460 less during the present receding year.

12. The details of the 862 prisoners transferred during the year are given below:

	1864-65.	1863-64.
d from one district to another for trial for confinement	770	288
for transportation	84	180
to lunatic asylums from sub-division Lock-ups to Sudder Jails Jails while in transit from one district to		2
ıer	<i>ti</i>	98
Total	862	518

13. The number of prisoners acquitted or otherwise released is shown in the annexed table:—

	1864-65.	1863-64.
Iter trial by the Magisterial authorities of the district  by the Session Judge  by the Sudder Court  rated by order of Government  sed on expiry of sentence  on payment of debts, &c.  for good conduct  for extreme sickness  Total	754 136 1	524 127 6 2,167 154 2

- 14. Of the 2,876 releases, 891 were acquittals, bein than during the previous year.
- 15. The large number of releases on accoccurred from the Kurrachee Jail during the epic tween January and April 1864, under circumstance reported to Government at the time, and regardin

ment have recorded their views in Resolu September 1864.

- 16. Out of a daily average number of prisoners, a.
- Deaths.

  1,499, there were 72 deaths against 22 an average daily strength of 1876 dup previous year. This marked decrease is due, as already st severe epidemic at Kurrachec during 1863-64, and is a exceptional.
- 17. (f the 72 prisoners who died, one was a femal maining 71 males.
- 18. The ratio per cent of deaths to average strength against 11.94 in the previous year, and the percentage of  $d\epsilon$  males to the male population or the actual number in confin was 1.63 and of females 93.
  - 19. The following table gives information under this in a detailed form in accordance with supplied in Doctor Mouat's last report.

	In 1864-65.	ž
Aggregate number of prisoners of all classes sick and well in custody	547,146	
Daily average number of prisoners  Aggregate number of prisoners admitted into the Jail		0.50
hospitals Number discharged cured	1,593	3,76 3,396

TOTALS.					100
All causes	1,642 1,642	72 72	4·38 4·38	3,647 3,647	224 6·14 224 6·14

- 22. With reference to the 14th paragraph of the Resolution of Government No. 2374 of the 22nd of July 1865, in which the classing of suicides and executions under the head of violent diseases is pointed out to be inappropriate, I would respectfully explain that suicides and executions are regarded as diseases only in those rare but possible cases in which they come under treatment.
- 23. In the table in paragraph 8, it will be observed that there were 11 executions, and that they are there entered as one of the modes of release or disposal, yet in the preceding table which gives the hospital statistics or admissions and deaths from different classes

ons have been excluded, because they were next. Their inclusion in this table in the previous port, though in accordance with the practice in Bengal, was us.

This classification, however, is adopted in the forms of pital Returns issued from the Medical Department, and by Jouat in those which are annexed to his annual reports, ould respectfully submit that, under the explanation above should be retained.

25. The deaths and ratios of deaths are eligion. exhibited in the subjoined table according to religion:—

-	I	n 1864-6	5.	In 1863-64.			
	Daily average strength of the respective classes named.	Deaths.	Ratio of deaths to aver- age strength as per column 1.	Daily average strength of the respective classes named.	Deuths.	Ratio of deaths to average strength as per column 4.	
	1	2	3	4	5	6	
Hindoos	190	6	3·16	228	9	3.95	
Mussulmans	1,292	65	5.03	1,631	213	- 13:06	
Christians	8	••		5	••	••••	
Other denominations	9	1	11.11	12	2	<b>16</b> ·6 <b>7</b>	
Total	1,499	72	4.8	1,876	224	11:94	

26. The rates of mortality during both years were greatest among Mussulmans, excluding those entered under the term "other denominations," whose numbers are too small for any fair comparison.

Sex.

27. The deaths a respect to sex are given table:—

	Į I	1 1864-6		In 1563-64.			
	Daily average strength of males and females in custody.	Deaths.	Ratio per cent of deaths to daily average strength respectively of males and females in custody.	Daily average strength of males and females in custodiv.	Deaths.	Rat	
Males	1,471	71	4.83	1,847	234	1:	
Females	28	1	3.57	•29	••	• • • •	
Total	1,499	72	4.8	1,876	221		

28. The rates of mortality for both sexes were 4.8 for under report, and 11.94 for the preceding one; the incress latter is assignable to causes already specified; the number of femous, however, so small as scarcely to admit of any fair comparation results.

Period of confinement at time of death.

29. The period after date of imprisonment at which death occurred is given in the annexed table:—

	In :	1864-4	G5.	1	63-64	<del></del>
	Daily average strength of Term and Life Prisoners in custody.	Deaths.	Ratio per cent, of deaths to daily average strength of Term and Life Prisoners in custody.	Daily average strength of Term and Life Prisoners in custody,	Deaths.	Ratio per cent, of deaths to daily average strength of Term and Life Prisoners in custody.
Term Prisoners.

In confinement without work,	30	2	6 66	272	••	••••
Grand Total	1,499	72	4.8	1876	224	11.94

- 33. Of in-door and out-door labourers, the highest rates of mortality occurred among the former during the period under report, and among the latter in the preceding year; but the rates in respect to the non-labouring and civil prisoners for the present year were in excess of either of the former.
- · 34. The out-door labourers here referred to are merely those employed in the gardens and in the vicinity of the Jail, many of the former being convalescent and weakly prisoners, and do not include those in Public Works gangs.

35. The death rates among prisoners imployed on the different kinds of labour are given below:—

And the second s	·					
	In	1864-	65.	In 1	863-64	• ,
TION OF EMPLOYMENT. $T$	Daily average strength of each class in custoly.	Deaths.	Ratio of deaths to strength in column l.	Daily average strength of each class in custody.	Deaths.	Ratio of deaths to strength in column 4.

and others excused from labour on account of physical debility Prisoners under trial	73 30	5 2	6·76 6·67	17 272	••	• • <sub>k</sub>
Grand Total	1,499	72	4.8	1,876	224	11.94

- 36. From the above it will be seen that the highest rates of mortality occurred during prisoners employed on light labour; this is explained that prisoners selected for this kind of labour are the weak, convalescent; and during the past year among those engaged cellaneous work the healthiest were those employed as Jail
- 37. Of out-door labourers, those employed on the roachighest rates of mortality, and excluding the small number first heading, those engaged on miscellaneous works e lowest rates.
- 38. The mortality among prisoners under trial is as that which may be called exceptional among the aged, convar and debilitated.
  - 39. The sentences of those who died, and the proportion deaths to the different terms of the sentences.

    Sentences.

    are exhibited in the annexed table:—

	In	1804-	65.	In 1863-'		
	Daily average of Presoners senten- ced for the periods named.	Deaths.	Ratio per cent. of death, to dails average strength as per column 1.	Daily averace of Prisoner senten- ced for the period- named.	Deaths.	(

rates of mortality occurred during the two ...enced to above 10 years, but their numbers are

, sair comparison.

All the rates in 1863-64 are excessive, owing to the fatal at Kurrachee. During the past year the lowest rates among prisoners under sentences above 5 years and up to and above 6 months and up to 1 year. The anterior and ate periods show a comparatively high death rate.

In the annexed table are given the classes of criminals among whom death occurred in the largest proportions:—

		Iu 1864-65.				In 1863-64.			
t	1	2	3	4	5	5	7	8	
LASSES.	Daily average etrength of each class in custody.	Deaths.	Ratio per cent. of deuting to average strength in column 1.	Ratio per cent. of deaths to total casualties.	Daily average strength of each class in custody.	Deaths.	Ratio per cent, of death- to average strength in column c.	Ratio per crat, of deaths to total casualties.	
Thieves	479	37	7.72	51:39	708	80	11:30	35:71	
Cattle stealers	271	15	5.54	20.83	369	33	8.94	14.73

ty of imprisonthose of other districts, are given below:—

•	In	1864-6	iā.	In	1863-	<b>5</b> 1.
	Daily average strength of Prisoners of the classes named.	Deaths.	Ratio per cent. of deaths to daily average strength in column 1.	Daily average strength of Prisoners of the classes named.	Deaths.	Ratio per cent. of deaths to daily average strength in column 4.
Prisoners of the districts	1,440 59	70 2	4·86 3·39	1,605 271	196 28	12·21 10·33
Total	1,499	72	4.8	1,876	224	11:94

- 53. The number of casualties, as welk were greatest among prisoners of the distriction imprisoned during both years. Transfers from our not appear to have enhanced the rates of mortality.
  - Deaths according to amount of sickness occurred in t season. of April, May, October and Decen the year 1864-65, and during 1863-64 in the months of February, March and May. The rates of sickness genera out this year are high and exceptional, and contrast unfavouthose of the year under report.
  - 55. The rates of mortality were in 1864-65 highest January, March, April and June; and during February, Marc April in the previous year.
  - 56. It is satisfactory to note that during neither of years under comparison did cholera make its appearance in Sind Jails.
  - 57. The cases of dysentery were comparatively so for the two years as scarcely to be said to preponderate during cular month. Of diarrhoea the rates of mortality were highest April during 1864-65, and in January, February and March during the previous year.

(

- 58. Fevers were most fatal in June, January and April during 1864-65, and in February, March and April during the previous year, during which months the epidemic already alluded to was at its height.
- 59. All other diseases were most fatal in November and January in 1864-65, and in December, February and March during the previous year.
- 60. On a review of these data it would appear that the most fatal months were January, March and April during the year under report, and February, March and April during 1863-64.

-	47		48	1,18	27	1,20	1,656	8	1,69	21	<u> </u>	100			

74. This mode of calculation, adopted by the Inspector General of Jails, Lower Provinces, gives the death rate possibly in too favourable a light, but taken in connection with the following figures perhaps a truer conception of the real average mortality may be gained in this way than by calculating the rates on the average strength, as is usually done, and as has been shown elsewhere.

Comparative statement of mortality calculated on the average and actual prison population. 75. In this table are shown the death rates on the average and actual strength together with the mean rates:—

				,	:				1									
ي علام	f:/s	्या.		popu	al pri lation	n of	Des	ths	٠.	to da	of de ily ave gth in	rage		of de son pop tion.		mortal fron metho	n ratio lity de the to ds of c ation.	rived Wo

.lı	. —	n :	nal		of	the	ab	ov	e i	abl	e gi	ves t	he f	follo	win	g re	sults	L_ s:
Deaths of Ratio per Prison por Total pri Total dea Ratio per Mean rat	centerage centerage pula f femonson pula centerage cente	of tion less tales t. coop	bot n of moulat	er of h se:	fen  kes  4-68  ity  ng	nales  , na fer  amore  males	in ale	s les	usi	tody cesales							24,965 70 77 4,965 7 7 (6	1 4·83 8 1 3·57 9 2 4·8 8 7 1 1 1·43

77. From the above it will be seen that deaths calculated on the average strength was 4.0, population or actual strength 1.42. The mean rate was probably represents a fair and reliable average.

78. The number of escapes and tures as compared with the previous given below:—

Years.	Daily average strength.	Number of escapes.	Ratio of escapes to strength.	Number of recaptures.	Ratio of recaptures to escapes.	Amount of reward paid for the recaptures.	
1864-65 1863-64	1,499 1,876	14 12	·93 ·64	4	28.6	••••	-

79. The escapes were rather more numerous during the Of the 14, 1 took place from within Jail walls, 4 from outside the Kurrachee, 6 from without also, at Hydrabad, and 2 from Shi 1 was effected from the Hydrabad Jail Hospital.

80. The number remaining at large at the close of the year under report is here shown:—

	Males.	Females.	Total.
Remaining uncaptured at the close of last year  Add escaped this year	12 14	••	12 14
Deduct recaptured of escapes of former years	26 2	••	26 2
" " of this year's escapes	24 4	••	24 4
Remaining uncaptured at the close of this year	. 20		20

es during the last two years 6 only were recapmined at large.

This is a large proportion, and the subject demands the n of the Police authorities.

The state of education among the 3,628 prisoners admitted into the Jails during the year is here exhibited:—

-	Prisoners fairly educated for their position in life.				Prisoners who can only read and write.				Prisoners entirely ignorant.					
YEARS.	Number.		whole stody.	Number.			whole stody.	N	whole stody.					
•	Male4.	Temales.	Total.	Proportion to whole number in custody.	Males.	Females.	Total.	Proportion to whole number in custody.	Males.	Females.	Total.	Proportion to whole number in custody.		
	40		40	1.1	<b>4</b> 60		60	1.65	3,447	81	3,528	97.25		
•••••••	77	••	77	1.88	63	••	63	1.54	3,869	79	3,945	9 <b>6·5</b> 8		
	103	••	103	2.24	103	••	103	2.24	4,313	0ù	4,393	95.52		

- 84. From these data it would appear that 1.1 per cent. of the prisoners were fairly educated, 1.65 per cent. could read and write only, and that 97.25 per cent. were entirely ignorant.
- 85. A comparison of these results with those of the two previous years shows that education among the criminal class has made no progress; on the contrary, that there has been some retrogression.
- 86. In the following statements are given in detail the financial results of the administration of the Jails for the official year under report.
- 87. The manner in which the average number of prisoners

  Disposal of prisoners sentenced to labour during the two last years

  sentenced to labour. were employed is given below in detail:—

	In I	· .		
· •	Average number.	Percentage on the average number in confinement.	Average number.	
Employed in ordinary manufactures.  Hired by the Department of Public Works  ,, by other departments  Employed as Jail servants.  , as guards  ,, on the roads  ,, on miscellaneous duties  ,, on light work, being convalescent, weak, or old  Inefficient from age Sick in hospital  Excused labour on account of Sundays and holidays	65 26 51	25·39  17·53 13·04 1·26 7·85 15·92 4·56 1·82 3·58 9·05	316 97 249 301	21
Total	1,426	100:00	1,494	

- 88. It appears from the above that, although the average number of prisoners sentenced to labour during 1864-65 was less than during the previous year, yet the number of those employed on manufactures had increased, and it is satisfactory to find that the percentage of those employed as Jail servants had fallen from 16.67 to 13.04. The extension of the system of convict intra-mural guards is also apparent from the above details, and is a satisfactory indication that its introduction is becoming more general.
- 89. The following data give the result of the labour of the 362 prisoners employed on manufactures within the Jail, as compared with the operations of the previous year:—

In 1864-65. In 1863-64.

Tf manufactured articles sold, for which was realized and paid into the trea-				
was realized and paid into the trea- 13,874	13	10 17,794	14	4
manufactured articles used for public 4,284	10	0 2,042	4	0

ofits of the year	8	1 7,193	2	6
t the previous year	2	6 Informa forthco	tion min	not z.
Decrease 1,595	10	5	- • •	

- 90. There has been a falling off of Rupees 1,355-15-11 in the gross receipts of the year, and of Rupees 1,595-10-5 in the net profits. This result appears inconsistent with the fact already mentioned, that there had been an increase in the number of prisoners employed on manufactures.
- 91. This apparent inconsistency will, however, be explained on a reference to the following table, from which it will be seen that the average earning per prisoner at Kurrachee amounted to a merc trifle.
- 92. The epidemic which proved so fatal at the close of the year 1863-64, and the release of a large number of the survivors, put a stop to all factory operations for the greater part of the succeeding year, which have scarcely, even up to this time, been entirely revived.

•	Earning o each manufac- turing Pri- soner.			i'n	<del>-</del> -	
,	Its.	a.	р.	Rs.	a.	p. B
Kurrachee	0	15	<b>3·</b> 3	96	5	10
Hydrabad	11	11	<b>3</b> ·3	72	5	4
Shikarpoor	47	7	2	58	9	2

93. It was impossible to contend against circumstance toward and calamitous, and it is to these alone that the untifinancial results of the manufacturing operations are attributable.

Jails in which there 

94. There has been an increase of pure was an increase. in one Jail only, as given below:—

Number.	Jail.	Names of Officers in charge, and periods of service.	Names of Jador and periods of service.	Amount of increase.	ie.	
1	Shikarpoor.	G. C. Grant, Esquire, Session Judge, from 1st May to 10th December 1864 W. A. Ingle, Esquire, Deputy Magistrate, from 11th December 1864 to 11th January 1865 Doctor J. Ffelliott, from 12th January to 30th April 1865.	Mr. Woodward.	Rs. a. p.	The same of the sa	1

95. This result is satisfactory, and might, it is believed, be largely increased, were a permanent system of intra-mural labour permitted to be established, uninterrupted by indiscriminate transfers to Public Works gangs.

Jails in which there was a decrease..

96. In the two other Jails there was a falling off in the profits to the extent shown in the following table:—

		officers in charge and periods of scrvice.	Names of Jailor and periods of service.	Amount of decrease.	Average of decrease per Prisoner.			
		A. II. Plunkett, Esquire, from 28th August 1864  A. II. Plunkett, Esquire, Deputy Magistrate, from 28th August to 27th September 1864  A. II. Plunkett, Esquire, Deputy Magistrate, from 28th September 1864 to 30th April 1865	Mr. Horne.	Rs. a. p.	Rs. a. p.			
\-\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \	Hydrab',	Major Widdicombe, from 1st May to 9th November 1864.  W. T. Cole, Esq., Deputy Magistrate, from 10th November to 28th December 1864  Doctor Hopkins, Civil Surgeon, from 29th November to 14th March 1865  B. Bradford, Esquire, Deputy Magistrate, from 15th March to 30th April 1865	Mr. Phillips.	2,860 10 7				

97. In the case of Kurrachee this falling off is susceptible, as already noticed, of satisfactory explanation, but at Hydrabad the factory operations demand more careful attention.

General financial results of labour of all kinds. 98. This information is contained in the following table:—

	In 1864	
Net profits on ordinary manufactures	5,597 8 1	10,
Amount credited to this department for value of convict labour hired to the Department of Public Works	1	23,
Amount received for value of convict labour lent to other departments		4,727
Amount of fines in commutation of labour	•	• • • •
. Total value	11,280 1 5	38,54/
Against of the preceding year	38,543 14 11	41,67
Showing a decrease this year of	27,263 13 6	3,132 6 1

99. There has, on the whole, been a large decrease amounting to Rs. 27,263-13-6 in the financial results of the year. The breaking up of the Hand's Hill and Manora gangs and the entire stoppage of the factory at Kurrachee, in consequence of the epidemic at the close of the previous year, are the reasons which have chiefly contributed to this very unsatisfactory financial decrease.

Jails in the order of the results of manufactures. 100. The details under this head are given in the table below, in which the most successful manufacturing Jail is placed at the head of the list:—

AME OF JAIL.	Number of years during whic; inanufactures have been carried on.	Average number of Prisoners sentenced to labour.	Average number of Prisoners employed on manufactures.	Amount of profits in 1864-65.		•	soner employed on manufac-	tures.	1	Proportion of profit on each Pri- soner sentenced to labour.	-
. arpoor	••	579	94	4,460	2 0	17	7	2	17	7	8
drabad		465	82	959	12 10	11	11	3.3	2	l	9
· Aurrachee	••	382	186	177	9 3	0	15	3.3	0	7	5

101. The average number of prisoners employed on manufacturing bears far too low a proportion to the average strength of intenced to labour. The cause of the results being so small rachee arises from those employed being inexperienced, or rners, at the time the manufacturing operations were re-estate.

In the following table are given the details of the cost of Jeneral expenditure, maintenance of the prisoners in the three Sind Jails:—

	In 1864-65. Prisoners 1,499				1863-64. Prisoners 1,876,							
Food.	Rs.	a.	p.	Rs.	a,	p.		a.	Ų;	}		
Rations	55,213 313			55,526	15	10	65,625 1,824	13	11	67,450	9	9
Establishment.	•			e.								
Fixed Executive Staff and Police Guards	34,265 4,429		1 0	38,694	11#	1	43,760 2,925	9 7	7 4	46,686	0	11

		34-65. s 1,499.				Pı.		_		
Hospital Charges.	Rs.	a.	p.	Rs.	a.	p.	Rs.	a.	p.	Re
European medicines	87	3	4				103	<b>1</b> l	9	
Bazar ditto	336	5	5				526	11	2

Decrease				29,75	3	99	Increa	ase.	••	12,175 14 2

- 103. These data are satisfactory, showing a decrease in the gross cost of maintenance of Rupees 29,753-9-9. The decrease, although general under every head of expenditure, and an evidence that economy has been attended to, is yet partly due to the smaller number of prisoners in the Jails during the last year.
- Detailed cost of each prisoner is given in detail in the following table, and amounts to Rs. 73-5-5 against prisoner.

  Rupees 74-7-4 during the previous year:—

	1864 Prisoner	-	1863-64. Prisoners 1,876.						
Food.	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.					
luding money allowance.		37 0 8	•	95 15 4

Against of the previous year		74 7 4	•	73 7 1					
Showing a decrease of		า เร็า	Increase	1 0 3					

<sup>105.</sup> It will thus be perceived that there has been a decrease in cost of Rs. 1-1-11 per prisoner during the past year, which, on the whole, is a satisfactory result.

Cost of food. 106. The cost per prisoner for rations is here exhibited:—

No.	Names of Jails.	ote. er per in 18	otes. er per s in 1864-65.		
		Rs.	a.	p.	Rg
1	Kurrachee	48	10	3	
2	Hydrabad	36	8	6	
3	Shikarpoor	29	9	11	

107. This increase is entirely due to the high price of for charge at Kurrachee appears excessive, and might, it is believed reduced by closer attention on the part of the local officers, and is bably by adopting the departmental system of provisioning.

Cost of clothing.

\*108. This is shown in the annexed '-1 to have been highest at Hydrabad and at Shikarpoor:—

No.	Names of Jails.	Average cost of each prison- er per anumn in 1864-65.			of er				
		Rs.	a.	p.	Rs.	a.	p.		
1	Kurrachee	Rs.	12	4	6	7	5		
2	Hydrabad	6	1	3	6	12	2		
3	Shikarpoor	2	15	6	3	5	7		

109. The decrease, as compared with the previous year in the latter Jail, though small, is satisfactory.

Cost of fixed establishment.

110. The table shows a decrease at Shikarpoor and Hydrabad under this head, but an increase at Kurrachee:—

NAMES OF JAILS	Averag of each er per in 18	c co priso anni 33-6	cost rison- nnum 3-64.			
	Rs.	ε.	p.	Rs.	a.	р.
k urrachee	29	13	0	20	6	4
ydrab <b>ad</b>	1	1		l	15	5
ikarpoor	17	14	10	22	5	8

I. The increase at Kurrachee is stated to be the inclusion of st of reliefs of guards which had been omitted in the calculation for the preceding year.

n

Jost of extra esta
Johnnent.

3.

112. There is a decrease in this item at Shikarpoor and an increase in the other two Jails:—

	<b>~</b>	Names of Jails.		e cost prison num 4-65.	er in	Average cost of each prisoner per summ in 1863-64.			
<b>'</b>	- v <b>-1</b> ,		Rs.	a.	р.	Rs	. a.	р.	
	1	Kurrachee	4	11	6	1	2	5	
	2	Hydrabad	2	14	5	1	10	1	
	3	Shikarpoor	1	12	10	2	4	8	

- 113. The increase at Kurrachee is partly due to extra guards having been rendered necessary for the prisoners removed into tents during the epidemic, and who were not returned into Jail until after the close of the year.
  - 114. This return is imperfect, the information from Kurrachee Cost of European having been received too late for insertion. medicines. The cost, however, is trifling.

No.	Names of Jails.	Average cach pusone annum in 1864-65.	
		Rs. a. p.	Rs.
1	Kurrachee		
2	Hydrabad	0 2 9	
3	Shikarpoor	,	1

115. There was no charge on this account at Shikar debitable to the year under report.

Cost of bazar medicines.

116. This information also is incomple for the reason above assigned:—

No.		each per at	priso	eer in	Averag each per s 18	. •	'K.
	Kurrachee	Rs.	a.	p.	Rs.	a.	<b>p.</b>
2	Hydrabad	0	l	7	0	8	10
3	Shikarpoor	0	7	8	0	8	] i

- 117. Both of these charges are trifling, and indicate attention to economy on the part of the medical officers.
  - 118. These include hospital diet, furniture, and all expenses other than those contained in the preceding two tables:—

NAMES OF JAILS.	Averag cach p per an 186	riso	ner in	Average cost of each prisoner per annum in 1863-64.			
4	Rs.	a.	p.	Rs.	a,	p.	
achee	. 1	10	3	2	12	.1	
Trabad	0	0	4	•			
arpoor	0	6	2	0	10	0	

\$9. These results are satisfactory and show that economy has rearefully practised by the Civil Surgeons.

ost of additions and cuted by the local officers by prison labour.

	NAMES OF JAILS.  NAMES OF JAILS.  Average cost of each prisoner per amum in 1864-65.		er in	Average cost of each prisoner per annum in 1863-64.				
	e di	Rs.	a.	p.	Rs.	a.	p.	
1	Kurrachee	0	8	6	1	2	2	
2	Hydrabad	1	5	5	0	8	1	
3	Shikarpoor	2	15	7	5	10	7	

;

- 121. The mud Jail buildings at Hydrabad and Shikarpoor are more costly than the more substantial building at Kurrachee.
- Cost of contingencies.

  Cost of contingencies.

  Cost of contingencies.

  Cost of contingencies.

  are high; a costly item, however, included under this head, is the transfer of prisoners, and to this cause may chiefly be attributed the high average cost per prisoner:—

No.	NAMES OF JAILS.	Average each per at 186			
1	Kurrachee	Rs.	a. 4	p. 0	Rs.
2	Hydrabad	2	1	3	
3	Shikarpoor	2	6	6	:

123. The three Jails are placed in the order of econas regards the gross cost in the follow table:—

No.	NAMES OF JAILS.	Average cost of each prisoner per annum in 1564-65.			Average each per average 186		
1	Shikamaan	Rs.		p. 0	Rs.	a. 13	
i	Shikarpoor	58	9	U	57	10	4
2	Hydrabad	72	5	4	81	6	4
3	Kurrachee	96	5	10	79	5	3

124. The cost of maintenance at Kurrachee demands the serious aftention of the officer in charge; at Hydrabad, although there has been a decrease, it is still too high, and the closest attention to economy is demanded.

Net cost.

125. This represents the cost per prisoner after deducting the value of prison industry:—

NAMES OF JAILS.	Average cost of each prisoner per annum in 1864-65.			Average cost of each prisoner per annum in 1863-64.				
	Rs.	a.	р.	Rs.	a.	р.		
actrachee	. 95	7	7	53	2	3		
¦ra ydrabad tar	55	6	6	66	12	2		
hikarpoor	45	15	6	49	1	4		

126. Both Shikarpoor and Hydrabad show a decrease in the cost cost, whereas the increase at Kurrachee is far from satisfactory, such it is chiefly accounted for by the interruption in all manuage operations consequent on the epidemic.

e of cost.

127. This refers to the gross cost which has increased at Kurrachee and Shikarpoer:—

No.	Jayls.	1864-65.		4-65. 1863-64.				Increase in 1864-65.				
		Rs.	a.	p.	Rs.	a.	p.	Rs.	a.	p.		
1	Kurrachee	96	5	10	79	5	3	17	0	7		
2	Shikarpoor	58	9	0	57	13	2	0	11	10		

128. The cause of increase at Kurrachee has already been explained; at Shikarpoor it appears to have been chiefly owing to the increase in the cost of rations.

Decrease of cost.

129. This has taken place at Hydrabad to the extent of Rupees 9-1 per prisoner, as shown below:—

No.	Jail.	1864-65.	<b>1</b> გი.	.1
1	Hydrabad	Rs. a. p.	Rs. a.	p. Rs

Gross and net cost of the prisoners.

130. This information for the well as for the three preceding years, in the annexed table:—

	priscuers.	Gro	ss cost of mainte	rance.	r pri-	Jails	ģ
YEARS.	Average number of pris	Cost of food, cluthing, eachbirhisment, con-tingeners, &c.	Gost of repairs.	Total.	Averaga gross cost her sager.	Doduct income of the trum all sources.	of maintenance.
		Rs. a. p.	Rs a. p	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs.
1862	1,466	99,951 13 7	1,048 11 0	101,600 8 7	09 4 10	24,646 14 10	76,9.
1863	1,735	123,557 13 0	3,951 1 0	127,508 14 (	73 7 2	41,676 5 8	85,832 8 10
1863-64	1,876	1 <b>3</b> 5, <b>71</b> 5 <b>4</b> 8	3,969 8 3	139,684 12 8	74 7 4	<b>35,</b> 391 <b>1</b> 7	104,293 11 155 8
1864-65	1,499	107,277 4 4	2,653 14 7	100,931 2 11	78 5 5	16,314 3 0	93,616 15 11 62 7 3
Total	6,576	466,502 3 2	12,223 3 (	478,725 6	72 12 9	118,028 9 1	360,696 13 7 54 13 7

- 131. The average gross cost of maintenance has been less than during the three preceding years, but rather higher than in 1862; this has been effected in spite of the heavy and increasing cost of every article of consumption as well as of Police guards.
- 132. The average net cost, however, does not give so favorable a result, and this is owing to the chief source of income, viz. the manufactures, having entirely failed at Kurrachee for reasons already frequently alluded to.

ne source of revenue which, if successfully leel confident, cover one-third of the Jail expension. Province. I refer to the manufacture of gunny bags, there is at all times a large demand and ready market.

I have endeavoured to introduce this branch of industry, o extensively and profitably carried on at Alipore and elsehe Lower Provinces of Bengal, but as yet, I regret, with-

- a) The attention of the local officers shall again be directed jet, and every endeavour made to attain so important an the reduction of the enormous expenditure with which the at present burdened.
- 136. A tabular statement is attached to this Report embodying of the information contained in the monthly returns from the Lock-ups of the different districts.
- 7. From this it appears that there were during the year prisoners confined in the Lock-ups. Of these, 5,243 were red to District Jails after conviction or for trial before the Judges, 4,317 were acquitted, 3,112 released without trial, ed. The number remaining in confinement at the close of the year was 580.
- 138. The total cost on account of these prisoners was Rupees 49,733-12-7; the average cost cannot be given in the absence of information as to the daily average strength, but it is small as compared with that of the Jails.
  - 139. A table is also appended giving such details as are available regarding the number of reconvictions during the year, together with their crimes and sentences.
- 140. At Kurrachee it is reported that no case of reconviction appears on the records. At Hydrabad there were 75, 33 of which were for theft. At Shikarpoor 25, 11 of which were for cattle stealing and house trespass.
  - 141. The sentences awarded varied from 6 months to 5 years.

- Concluding remarks.

  Of mortality, owing to the about and the care and attention devoted arrangements, and a decrease in the net profits of prison lab industry, due to causes which have already been explained.
- 143. The system of dry-earth sewage is successfully c in the Jails in this Province, the climate of which is pecul adapted for such a purpose.
- 144. My suggestions on all matters of Jail managen met with attention; defects in sanitary and disciplinary arran which had been previously noticed, now no longer exist, an system of intra-mural labour organized on a permanent footi. transfers, frequently of skilled convicts trained with much plabour and at considerable expense, to Public Works gangs, plated, not only would the profits from prison industry be larg increased, but a uniform and much more efficient system of disciplished.
- 145. Under such a system not only would the disciplifinancial position of the Jails be improved, but the rates of and mortality would materially decrease.

C. G. WIEHE, M.D.,
Inspector General of Prisons.

Inspector General of Prisons' Office, Poona, 20th February 1866.

#### KURRACHEE.

Government in consequence of an epidemic of fever which proved extremely fatal.

Details regarding the number and disposal of the 404 prisoners in this Jail are given in the annexed table:—

ý ] os	Male.	Female.	Total.
ra '			
-ite of the daily number of prisoners of all			
s, sick and well in custody, during the			1
1864-65	.45.886	1,506	1,47,392

These results are extremely satisfactory, 'that the sanitary measures adopted in consequent have been very successful.

#### SHIKARPOOR.

Inspection.

Not inspected.

The report furnished by Dr. Ffolliott, the officer in this Jail, is so concise that I subjoin it, with but a few exceextenso.

#### Jail Buildings.

- . "The Jail buildings underwent extensive repairs during past year, the sum of Rupees 1.771-3-6 having been exper thereon by the Public Works Department, details of which furnished in Statement No. 14.
- "The high wall which divided the new from the old Jabeen removed by prison labour, and the debris used in filling I and improving the drainage of the Jail compound.
- "A cooking house has been made in the female priso experimental measure, with a view to have the whole of the prison food prepared by the female convicts, if practicable. It has now had a fair trial for 11 months, and has been found very successful; the food being better prepared, and a system of peculation, which under the old plan it was difficult to guard against, defeated.
- "The alterations recommended in relation to the sleeping barracks have not yet been carried out, but the work is in the hands of the Executive Engineer, and will be commenced at once, and I hope completed before the close of the ensuing hot season, during which the prisoners sleep upon the ground in the open air, and do not require the barracks."

#### Prisoners and their Disposal.

"The subjoined abstract exhibits particulars regarding the prisoners during the year, viz:—

an	Male.	Female.	Total.

€ 1€	4	1	5
v ng in Jail on the 30th April 1865	626	17	643

"The number of criminals sentenced to death amounted to 5, all of whom, with the above exceptions, were transferred to the Deputy Magistrates for execution at the scene of their crimes."

#### Conduct of Jail Officers and Prisoners.

"The establishment under the orders of the Jailor has worked satisfactorily, with the exception of the English writer, who was removed for incompetency, and replaced by a Parsee from Kurrachee, who, after a service of 3 months, got a better paid appointment in the Collector's Office, and was replaced by the present clerk, Mahomed Jumall. The efficient services of Mr. Woodward, the Jail Marshall, have been noticed in former reports, and I have much pleasure in recording my sense of his zeal in promoting Jail manufactures and prison discipline.

"There have been 467 punishments inflic the year for breaches of discipline. The offence, part trivial, and confined to a small section of bad most frequent being in default of performing allotted tasks, work, and being in possession of snuff, tobacco, &c. These followers are introduced by the Rural Police, but up to the they have managed to escape detection.

"The usual punishment is from six to thirty lashes witinine-tails on the bare back: as many as fifty lashes have ocheen inflicted for attempts to escape, but this is exception average number awarded being 'twelve lashes.' Generalling, the prisoners conduct themselves respectfully, and nevebine for any object, owing to the diversity of tribes and caste a them."

Labour and Manufactures.

F	186	4-65		186

Average number of prisoners daily engaged in manufactures	94	0	0	97	·••·	0 €
Net profit realized	4,460	2	0	3,619	7	1
Average earnings of each prisoner	47	7	2	37	5	0

<sup>&</sup>quot;Contrasted with the previous year the period under review exhibits a falling off in profits of Rs. 840-10-11. This decrease is attributable to the fact of no profits having been credited to the manufacture and making of the prisoners' clothing, and the impracticability of turning out cotton fabrics at remunerative prices owing to the high rates demanded for the raw material. The deficit is, however, apparent only, as the manufacture of prisoners' clothing from the raw material by Jail labour has been found more economical than purchasing in the bazar, and has helped to effect a saving in the total

of Rs. 0-6-1 as compared with the previous prabour a sum of Rs. 5,661-5-7 has been realized, and average earning of Rs. 21-7-1 per prisoner.

Fie following table exhibits the works upon which the prisonemployed, and the amount realized on each:—

in niring Bund of Sherwah Canal	rs. 3,930		p.	
# juting pand of Suctional Canal	•			
ing and cleaning canals	1,287	4	0	
riring roads	443	11	0

<sup>&</sup>quot;The daily ration of each prisoner during the past year has cost 1 anna and 3 pies against 1 anna and 4 pie only in the previous year.

The increased expenditure is owing to the higher of food during the period under review. Destruction deficient harvest, and a famine in Kutch combined to value of grain in Sind throughout the year.

"Under the head of clothing, &c., a sum of Rs. 192-10-8 in of the previous year has been expended to meet the increased ments of a higher daily average number of prisoners—there having been during the past and previous years 596 respectively.

"In the fixed establishment a saving of Rs. 156-14-5 is but, as no details have been furnished by the Captain of Po cause is not accurately accounted for, no reduction in the nut guards having been effected since last report.

"The hospital charges during the past year exhibit a saving Rs. 38-13-1 as compared with the previous year; the stock of E rope medicine and clothing on hand permitted a corresponding reduction in the yearly estimate.

"The contingent expenses are more by Rs. 397-7-0 than previous year in consequence of extra charges being incur transferring prisoners to Kurrachee for transportation and in purchase of dead stock.

"The total cost of each prisoner has amounted to Rs. 45-15-6 against Rs. 49-1-4 in the previous year, showing a saving in favor of the period under report of Rs. 3-1-10 per prisoner. This result is partly due to the savings enumerated in the preceding paragraphs and the great economy of the non-periodic system of clothing. Besides, a quantity of warm clothing remaining from the previous year was made available, and obviated the necessity for further expenditure under this head."

Classification.

"The prisoners are divided into six classes, viz:-

- 1. Prisoners sentenced to rigorous imprisonment.
- 2. Ditto ditto to simple ditto.
- 3. · Females.
- 4. Juveniles.
- 5. Convict guards and muccadums.
  - 6. Civil debtors.

of is sub-divided into hard labour and sedentary read as designated (details will be found in Statement

em he second class, or simple imprisonment and security men, are parate from all other prisoners; they are allowed to do light miritch as cleaning and spinning wool and cotton, but no pressure ingo force the labour. What they do, is for amusement and of irim accord.

that he number of females imprisoned during the year averaged dic y have distinct wards in a walled enclosure, and are employed scelling the prisoners' food. This is found a great improvement the system of allowing the male prisoners to cook; peculation has the defeated, the food is better prepared, and, in addition to these makentages, it supplies a fitting employment for the females.

"The juvenile offenders averaged 43 during the year. They talso distinct wards, and are kept apart from the elder prisoners a walled enclosure, and are taught some trade if sentenced Cosing period of imprisonment; otherwise they are employed in \_\_ng and spinning wool and cotton.

The fifth class is composed of convict guards and muccadums, selected from among the best behaved prisoners, in accordance with instructions received on the subject. The system works satisfactorily, and the average number employed during the year was 5.

"The civil debtors' prison is distinct from the criminal Jail and divided by a wall for male and female debtors."

#### Solitary Confinement.

"Solitary confinement being rarely awarded by the Magistrates as a punishment, the solitary cells are almost exclusively used for the punishment of refractory prisoners and security of condemned criminals."

#### Education.

"No attempts have been made in this direction."

#### Suveniles.

"The average number of boys under 15 years of ag during the year was 43. All sentenced to over six months a in charge of a muccadum to the factory during the day purpose of learning some trade. The short-term prisoners ployed under charge of a muccadum in cleaning and spinn and cotton, and all are kept apart from the elder prisoners, a in an enclosed yard during the night."

#### Reconvictions.

"During the period under report there have been 25 recontions. But the individuals were professional thieves who had other means of subsistence. The deterring effect of Jail discipli upon this class is doubtful; several cases having lately come may notice of prisoners, seemingly reformed and capable of ear living by trades acquired in confinement, having been recontinged than once."

#### Escapes.

"2 prisoners escaped during the year from gangs employed in out-door labour, were recaptured, and sentenced to additional imprisonment for the offence."

#### Gardens.

"The amount realized by sale of vegetables from the jail garden has amounted to Rs. 245-4-2. Deducting for labour and other expenses Rs. 28-4-0 the net profit amounted to Rs. 217-0-2. The garden is not large enough to supply sufficient vegetables to the prisoners throughout the year. More ground should be taken in, and the cultivation extended to afford a healthy employment for the prisoners and secure a supply of fresh vegetables throughout the year."

About one-half the number of deaths may be fairly attributed to the effects of cold caught at night for want of sufficient covering. The difference of temperature between the day and night ranges from 40° to 60°, and the ill effects of sudden fall in the temperature at night are increased by the tiled floors of the sleeping wards and the absence of doors and windows.

"When it is remembered that at least one-third of the number of prisoners who come from the left bank of the Indus have enlarged spleens, and suffer more or less with miasmatic cachexia, their unfavorable position in confinement will be apparent. Otherwise the health of the prisoners generally has been good, and no disease of an epidemic character has appeared during the year."

General remarks and recommendations-

"The desideratum in the Shikarpoor Jail is suitable in-door employment for the prisoners. The manufacture of gunny bags would,

in a great measure, supply this if it could be int tempt made during the previous year failed through workmen to teach the prisoners.

"Raw hemp can be imported cheaply and without trou Mooltan, and any quantity of the manufactured article would ready sale in Sukkur or Kurrachee. As no workmen can be in Sind who understand the manufacture of the fabric su gunny bags, I would recommend the transfer from the Jail to Shikarpoor of a few spinners and weavers to teach the working.

"Carpenters' and cabinet-makers' work find a ready Upper Sind, but the prisoners at present engaged in these are unskilled, and turn out only the coarsest articles. All manufactured are, however, sold at once, and this branch of industry susceptible of great extension.

"The manufacture of carpets and cotton fabrics generally habeen crippled by the high price of cotton, and is consequently limits orders and current demands.

"The conservancy of the Jail has been already reported of works satisfactorily. Dr. Ritchie, the Deputy Inspector Gene Hospitals, inspected the Jail on 21st of December 1864, and much pleased with the general cleanliness and the respectful bearing of the prisoners.

"In conclusion, I would invite attention to the fact, that the daily average number of prisoners during the year has been nearly 600, and is steadily increasing. The number was kept below 500 in former years by transferring prisoners to Kurrachee for employ-

ment upon the harbour works; but as those works have been stopped, and no more transfers are likely to take place, the average number will seldom be below 600 in the Shikarpoor Jail. Under these circumstances I would respectfully submit a proposition to increase the Jail and hospital establishments; under existing rules first-class hospital establishments are sanctioned to Jail containing an average of over 500.

"The sum sanctioned for the Jailor's salary is not sufficient to secure the services of a competent and trustworthy man. Mr.

the appointment on Rs. 10 per mensem less a the Collector's Office, upon the hope held out to used pay and advancement in this department.

entenant Grant, the Session Judge of Shikarpoor, who en the greatest interest in the development of the Jail factory on discipline, relinquished charge of the Jail on 10th Deast to Mr. Ingle, the then Hoozoor Deputy Magistrate, from received charge on his appointment to act as Deputy of Shikarpoor and Sukkur on 11th January 1865."

we much satisfaction in bringing to the notice of Government t attention devoted to the careful management of the Jail by Grant, the Session Judge lately in charge, and by Dr. 5tt, the Civil Surgeon at present in charge, and in bearing per-1 testimony to the success with which these officers' exertions e been attended.

## APPENDIX No. 11.

## SANITARY REPORT OF THE MEDICAL OFFICERS.

ON THE

### JAILS IN SIND,

FOR THE OFFICIAL YEAR 1864-65.

# ary Report of the Medical Officer on the Kurrachee Jail for the Year 1864-65.

Topography -- nature of climate -- rain-fall -- temperature :-

e soil about Kurrachee is tight clay or sandy, with rocky aces cropping out here and there. The elevation of the Jail site, tic of the native town generally, is low. The climate during the season was pleasant and agreeable, and cooler on the whole than tigenerally the case, westerly and south-westerly winds prevailing. May to the beginning of October; subsequently the winds were e, sometimes westerly, at others north-east. Rain fell in May, melugust, December, January, and March, and the fall for the as 9 inches and 31 cents, exceeding the usual average by some

, cl

The maximum temperature for the year was 108°, the minimum 42°, and the mean 75°.

II.—Position of Jail—with reference to city or camp.—Additions and alterations to buildings:—

The Jail is situated at the eastern side of the native town, and close to it, and rather more than one mile west of the camp.

It is proposed to remove the cells for untried prisoners and native debtors from their present position on the south-west side of the wall of the large sleeping yard in order that openings may be made in the wall for the better ventilating of that yard. It is proposed also to remove the cells for European debtors, but the sites for these cells, when removed, have not yet been determined.

III.—Total Number of Prisoners admit 1864-65:—

	ight on admissi et as ascertained		priso	eight on ad ners of othe Surgeon's s	r districts	as	
Nun-ber.	Average weight of prisoners on admission.	Average weight of prisoners on disclarge.	Number who gained or lost weight, or were stationary, with average of gain or loss.	Number.			7. g
266	Lbs. oz.	Lbs. oz.	101 lost, 33 gained, 132 stationary.  Average of gain. Lbs. oz. 2 8 .6.  Average of loss. Lbs. oz. 2 11 - 2.				

IV.—General Health of the Prisoners as deducible from the foregoing data—

The above table of weights extends over about ten months of the year only, as the weighing of prisoners was suspended during the late epidemic fever, and was not resumed till the month of June; hence long-sentenced prisoners are not included. The general health of prisoners for the last nine months of the official year has been remarkably good, and although there has been, in a considerable number of convicts, some loss of weight, their appearance has been that of well nourished men.

V.—Diet—its quality, sufficiency or otherwise; as a predisposing or exciting cause of any particular disease, and its effect on the general health of the prisoners;—modifications proposed—on what grounds—

rearance of the epidemic and the introduction of ary improvements subsequently the prisoners have been by healthy. During the epidemic it was found necessary extra diet for some months, and it was afterwards considered to allow \$\frac{1}{2}\$ ounce of ghee to each convict in place of oil, as a centers into the diet of all the people of Sind, who do not all.

-LABOUR—out-door or in-door—influence on the health of ners—ratio per cent. of deaths to treated in each class—

e out-door labour ceased just prior to the commencement of the year. In-door labour, therefore, was the only labour employed tic overal months; the only out-door labour that comes under this ription was carrying earth for the renewal of the surface of the stig compound, the floors of the sleeping pendalls and hospital, and the removal of nightsoil tubs.

medie number of in-door labour prisoners has been 313 and of ar 27, but no separate register of the number treated in each is been kept. The deaths all occurred in the in-door labour list.

measures for improvement—

The sleeping pendalls are all open on every side except during the cold season, when a date mat is hung up on the north-east side of each pendall. The hospital and all the cells are sufficiently ventilated at the top and at the sides by doors and windows.

It is proposed to make openings (large) in the south-west wall of the large sleeping yard for the purpose of increasing ventilation.

VIII.—CLEANLINESS—how maintained in cells and barracks and in the Jail generally—measures for improvement—

The floors of the cells, pendalls, and hospital and the yards are all swept daily, and the floors are cow-dunged weekly, while the walls of the several cells and of the hospital are white-washed several times a year.

IX.—Drainage—kind—state—defects; improvement—

There are very few drains in the Jail, and those who made of stone and chunam. They are in good condition, simply for the purpose of carrying off the refuse water from t used by the prisoners for washing and bathing. They are purpose required very well.

X.—Conservancy—what mode in force—with special to the dry-carth sewage—what deodorizers in use—night disposed of—defects or otherwise of present system—mea improvement—

Dry conservancy has been in use for the last 4 years, and last 10 months earth sewage has been employed in addition, other deodorising agent has been used since the earth system put in operation, which has answered the purpose admirably and destroyed all odour. Previous to this, chloride of lime and characteristic were had recourse to when needed. The nightsoil is carried in tubs without disturbance of their contents, and buried in a 1½ mile distant. I have no improvement to suggest.

XI.—Clothing—its cleanliness, sufficiency, or otherwise ffect on the health of the prisoners, with special reference to nary affections—

The clothing during the past year has been of a better description than formerly, and the usual quantity has been found sufficient; it is washed about once in ten days or so, and there has not been any tendency to pulmonary affections.

XII.—Overcrowding—average number during the year above capacity estimated at 500 cubic feet—its influence in the production of disease and mortality—temporary or permanent measures of relief adopted—

The average number of prisoners for the year has not exceeded 404, which has afforded very ample space for each prisoner, much within the above mentioned limit, besides which it must be remembered that the sleeping pendalls are open on all sides, thus affording the most free circulation of air.

causes to which the foregoing mortality is ascribable—suggesments to preventible means—

And and June there were 6 fatal cases of fever, viz. 4 of severe and and 2 of intermittent; these occurred in prisoners who had the present in the Jail, and who were more or less cachectic. The remaining cases were of the ordinary intermittent character complicated with bowel or chest affections, occurring in subjects of broken constitution. The cases of diarrhea were all complicated with chest affections or fever, and the subjects were all cachectic.

The only suggestion I can make as to prevention is the rigid carrying out of the sanitary rules now in operation.

XIV.—Epidemics—rate of mortality from them, with a brief account of their origin, progress, termination, and the means, therapeutic and hygienic, taken to arrest their progress—

There has not been epidemic disease of any kind prevalent in the Jail during the year.

XV.—Remarks—on the general sickness and mortality of the year, as deduced from all the foregoing data—

In the early part of the official year the management of the official year the management of the great prevalence in the months of January, February, March and ding, viz. the cachectic and reduced state in which it had left the prisoners. During the latter 8 months there were only 5 and the prisoners during that period have been remarkably h

XVI.—General suggestions as to the measures for ir the sanitary state of the Jail.

The sanitary condition of the Jail is so satisfactory as little suggestion for improvement. In the months of May, J July the prisoners were in tents, and during that period the of the Jail and the floors of the pendalls, cells and hospital we pletely renewed by fresh earth. The drainage is good, and the sy of conservancy as perfect as it can be made. It was recommer by a medical committee that the south-west wall of the new sleep, yard should have openings made in it for the better ventilation of tyard, and this subject is yet under consideration.

JOHN BEAN, Civil Surgeon

In Medical Cha

#### D. RITCHIE,

Dy. Inspector General of Hospitals,

Sind Division.

Sanitary Report of the Medical Officer on the Hydrabad Jail, for the year 1864-65, from 1st May 1864 to 30th April 1865.

I.—Topography—nature of climate—rain-fall—temperature—

Hydrabad is situated on the most northernly point of a chain of low calcarcous hills running parallel to the River Indus and at a distance of about  $3\frac{1}{2}$  miles from it, 99-35 feet elevation above the sea,  $40\frac{1}{2}$  above adjacent country.

Climate may be considered a medium between that of Upper Sind and Kurrachee, cold and bracing from the beginning of d of February, but hot and oppressive during months.

Itall during the year 10 inches 9 cents.

mperature during the hot months often 109° in the shade, and the cold season below 50 Fahrenheit

- Position of Jail - with reference to city or camp. - Addid alterations to buildings -

tion of the Jail very good, being highest to the north-east and to the north of the Hydrabad city.

e Jailor's house has been put in repair and the verandah ae outer gate.

III.—Total Number of Prisoners admitted during the

			re of prisoners of the s special register.	priso		districts as	discharge of ascertained r.
mei	l'Average weight of 'risoners on pluission,	Average weight of prisoners on discharge.	Number who gained or lost weight, or were stationary, with average of gain or loss.	Number.	A verage weight of prisoners on admission.	Average weight of prisoners on uischarge.	Number who gained or lost weight, or were station- ary, with average of gain or loss.
1927	114	106	No. gained 151, No. lost 291, sta- tionary 33, ave- rage gained 6 lbs., average lost 8 lbs.			••	••

IV.—GENERAL HEALTH OF THE PRISONERS—as deducible from the foregoing data—

The prisoners were very healthy till the month of January, and in March and April a great number of cases of fever and diarrhoea

occurred. The Jail is always so overcrowded prising that generally there is so little sickness.

V.—Diet—its quality, sufficiency or otherwise; as a proof exciting cause of any particular disease, and its effect general health of the prisoners;—modifications proposed—or grounds—

The diet table is herewith forwarded. It appears well s the natives of Sind. No modifications to propose.

VI.—Labour—out-door or in-door—influence on the of the prisoners—ratio per cent, of deaths to treated in each c

The in-door prisoners have suffered much more than the door ones—the percentage of deaths to treated amongst the in-being 12, amongst the out-door 1.

VII.—Ventilation—how secured—defective or otherwise measures for improvement—

Ventilation secured by roof ventilators, open windows, appear to answer very well, except in the hospital, where, owi there being no windows in the back wall, ventilation in th months is very imperfect.

VIII.—CLEANLINESS—how maintained in cells and bat and in the Jail generally—measures for improvement—

Cleanliness maintained by daily sweeping and watering, and cow-dunging the barracks once at least every week.

IX.—Drainage—kind—state—defects; with measures for improvement—

Water escapes from the Jail through a hole in the wall emptying into an open drain to the rear of the Jail, which is kept clean.

X.—Conservancy—what mode in force—with special reference to the dry-earth sewage—what deodorizers in use—nightsoil how disposed of—defects or otherwise of present system—measures for improvement:—

Dry-earth sewage in use, dry earth and wood ashes the deodorizers, nightsoil removed twice a day and buried at some distance to the rear of the Jail.

its cleanliness, sufficiency, or otherwise; its its of the prisoners, with special reference to pul-

- in convict is provided with two suits yearly of the usual Jail if the winter jackets being lined or quilted.

vanliness is maintained by boiling in water and potash.

monary affections very prevalent during the cold season.

OVERCROWDING—average number during the year above estimated at 648 cubic feet—its influence in the production te and mortality—temporary or permanent measures of relief

aily average of overcrowding during the year ending 30th of 1865—249. I think the great sickness during the past month the general sickly appearance of all, is to be attributed to overcrowd-tik, to relieve which a large number were transferred as follows:—

Transferred to Oomerkote	525
,, for transportation	6

(True copy.)

N. HOPKINS, Civil Surgeon.

### Sanitary Report of the Medical Officer on for the year 1864-65.

I.—Topography—nature of climate—rain-fall—temper. Shikarpoor inituated upon an alluvial plain in 60° 40' and 28° 10' E. long.; it is 22 miles west of the River Indus, a feet above the sea level at Kurrachee. The climate is dry ti out the year, with an excessively high summer temperature; winter. The thermometer ranges during the winter mont 27° to 110°, and in the summer from 80° to 135°. The annu fall is under 4 inches, and the total quantity gauged during t year was 3 inches and 91 cents.

II. - Position of Jail - with reference to city or camp-addr and alterations to buildings-

The Jail is situated upon the high road leading from Sukkur Jacobabad, about 600 yards S. W. of the camp and the same distan S. E. of the town of Shikarpoor. No additions have been made to the Jail buildings during the past year; a high wall which divided the from the old Jail has been removed, but the alterations recomme in relation to the sleeping barracks have not yet been carried out

III .- TOTAL NUMBER OF PRISONERS ADMITTED during the 1864-65-752.

Weight on admission and discharge of prisoners of the of other districts as ascertained from Surgeon's special register.

Weight on admission and discharge of prisoners

Number.	Average weight of prisoners on admission.	Average "weight of prisoners on discharge.	Number who gained or lost weight, or were stationary, with average of gain or loss.	Number.	Average weight of prisoners on adiassion.	 Number who gained or lost weight, or were stationary, with average of gain or loss.

HEALTH OF THE PRISONERS as deducible from the

ing in mind the fact that a large number of these prisoners is never performed a day's labour previous to their incarceration, cral health as deducible from the above data is rather favourn otherwise. The out-door labour during the past year was by severe, and the prisoners underwent great and unavoidable in repairing breaches in a canal to prevent a threatened in-

C. A large gang (350) was encamped for nearly four months elistant from the Jail, and to the hard labour and exposure if from it may be referred one cause of the decrease in weight.

Production of the prisoners; modifications proposed—on what the ounds.

The chief and most important article of food is wheat, which can be procured of good quality. Jowarce and bajree have ried from time to time, and found to cause derangements of the ch and bowels sufficiently serious to warrant their discontinient. The cale of diet at present in use is, in my opinion, insufficient, the prisoners very generally complain of it, and I believe it might be increased a little with advantage to their health. As I have in a late report considered this subject in detail I beg to refer to it, to obviate recapitulation.

VI.—Labour—out-door or in-door—influence on the health of the prisoners—ratio per cent. of deaths to treated in each class.

The out-door gangs are carefully selected, and composed of the most robust prisoners, and with a special reference to the previous occupation of the individuals when practicable: consequently, when no unusual amount of hard work is exacted from them, the percentage of sickness and mortality is not greater than among the in-door prisoners. The percentage of deaths to treated in each class during the period under review is, out-door 2, in-door 1.6; but the out-door labour during the past year was of an exceptional character, and three cases of death from sun-stroke occurred in the gang.

VII.—VENTILATION—how secured—defectmeasures for improvements—

The ventilation is defective, but improvements have be mended which, when carried out, will secure a better system the middle of April to the middle of October the prisoners the open air, and the barracks are only used in the event of dust-storms. During the winter months, from the positio doors and windows, the barracks are excessively cold, and t increased by the tiled floors. It is proposed to throw all the in each barrack into one by cutting arches in the partition reduce the number of doors and substitute windows, and to the tiles and substitute earth floors.

VIII.—CLEANLINESS—how maintained in cells and bar and in the Jail generally—measures for improvements—

The barracks are swept out every morning, and the walls m washed occasionally; from the nature of the soil and climate clean. ness is easily maintained, and I have no improvements to suggest this head. During the night dammered iron pots are placed ward for natural purposes—the pots are made in pairs to fix together, one being round and the other crescentic, and are on small heaps of dry earth to prevent their being upset. They removed in the morning by sweepers, washed and placed in the sun until required again in the evening. This plan is found very successful.

IX.—Drainage—kind—state—defects, with measures for improvements—

The drainage is maintained by surface drains, which are effective and require no improvements.

X.—Conservancy—what mode in force—with special reference to dry-earth sewage—what deodorizers in use—night-soil how disposed of—defects or otherwise of present system—measures for improvement.

All the privies in the interior of the Jail, with the exception of those in the hospital and female compounds, have been removed. The large privy referred to in a former report has been divided into

tying about exposed in the Jail compound, the as a privy and is found sufficiently large for the requirethe Jail. The system practised is the dry-earth sewage, and deodorizer used is dry earth. The privy is cleaned by the thrice daily, and the nightsoil removed and buried in the en. This system is very successful.

CLOTHING—its cleanliness, sufficiency, or otherwise; its the health of the prisoners, with special reference to y affections—

clothing used during the winter months is insufficient, ag merely of a woollen cloth jacket and an extra cumbly in on to the summer clothing. After being washed a few times it can be becomes threadbare and of little use as a warm covering, it has been found necessary to allow the prisoners to wear a little has been found necessary to allow the prisoners to wear a little has been found necessary to allow the prisoners to wear a little has been found necessary to allow the prisoners to wear a little has been found necessary to allow the prisoners to wear a little has been found necessary and would save the little has been as necessary, and would save the little has been to be washed (as a rule). The bedding is little has been to be washed the cold season. Steps have been taken to remedy these defects, which, when carried out, will cause a great improvement in the general health of the prisoners. The clothing is washed twice a week by men told off for that purpose.

XII.—Overcrowding—average number during the year above capacity estimated at 648 cubic feet—its influence in the production of disease and mortality—temporary or permanent measures of relief adopted—

Excluding the hospital, solitary cells and civil prison, the total capacity at 648 cubic feet to each prisoner shows accommodation for 500. The average number confined during the year was 597, which is rather above the available capacity. No sickness or mortality has occurred which can be referred to overcrowding, increased supervision was found necessary in the preparation of food and general conservancy of the prison, and all prisoners sentenced to 6 months' and under were detained in the district jails to relieve the pressure.

XIII .- MORTALITY-

rength		total daily gtb.	R	atio of deat	hs from di	iseases from	which t	he highest	<b>M</b>	
averag e strength risoners.	Total		Dys	entery.	Fe	vers.	Ch	olera.	Dit	
Total daily average s of prisoners.	deaths.	Ratio of deaths to average streng	Number died.	Ratio per cent. of deaths to strength.	Number died.	Ratio per cent. of deaths to strength.	Number died.	Ratio per cent. of deaths to strength.		
597	23	3.8	3	3.5	3	3 <b>·5</b>	·		6	

Causes to which the foregoing mortality is ascribable—su

The immediate cause of death in 5 cases was pulmonary differentially in 10 diseases of bowels, in 3 fever, in 3 sun-stroke, and ifferery in 4 service in above half the number of cases in my opinion, ascribable to the great vicissitudes of temperature during the cold season, and the want of sufficient clothing at night to meet this contingency. The bedding of a prisoner consists of a date mat 6 ft. × 2 ft. 3 in., a cumbly 5 ft. 9 in. × 3 ft. 11 in. and 10 lbs. 4 oz. in weight, and an extra blanket 8 ft. 2 in. × 4 ft. and 2 lbs. 2 oz. in weight. This is not sufficient in a season when the thermometer falls as low as 27°, and frosts are frequent. When this deficiency is remedied I have no doubt of a satisfactory improvement in the health of prisoners.

XIV.—Epidemics—rate of mortality from them, with a brief account of their origin, progress, termination, and the means, therapeutic and hygienic, taken to arrest their progress—

No disease of an epidemic character has appeared among the prisoners during the period under review.

on the general sickness and mortality of the room all the foregoing data—

imortality has amounted to 3.8 per cent. of the average it, the average number of sick has been 14.2 only out of a verage of 597 prisoners. If the 3 deaths from sun-stroke be ed accidental, and deducted from the total deaths for the year, ge will be very much below that of last year, and will be much the average of the past ten years. The average of former ynot be taken as a fair criterion, as the mortality appears to a kept down by the practice of releasing, while during the years no prisoner was released on account of sickness.

FORXVI.—General Suggestions as to the measures for impro-

The measures proposed to improve the sanitary state of the Jail ay be summarized as follows:—Improved ventilation and earth in the barracks, increase in the warm clothing during the winter as, and a little addition to the dietary. The extent of ground cultivation as a Jail garden is not large enough, and should be used by taking in more land; the married Police lines might be resed by taking in more land; the married Police lines might be ground, and the present lines given up to the Jail to be added to the garden. The privy could then be moved to the garden aspect of the Jail; its present position next the high road is objectionable, the sweepers having to walk a considerable distance on the road to reach the garden.

J. FFOLLIOTT, Civil Surgeon, Shikarpoor.

C. G. WIEHE, M.D., Inspector General of Prinal

## No. 182 of 1867.

JUDICIAL DEPARTM.

# Bombay Castle, 18th January 1867.

Letter from the Inspector General of Prisons, dated February 1866, forwards the Annual Report on the in Sind for the official year 1864-65.

RESOLUTION.—The gross expenditure on the jails of Sind in to year under report was Rs. 1,09,931. The daily average number of prisoners was 1,499, and the cost per prisoner was therefore Rs. 73-5-5 per annum, or about Rs. 6-1-9 per mensem.

- 2. In the year 1863-64 each prisoner had cost per annum Rs. 74-7-4, and the annual cost of each has therefore fallen Rs. 1-1-11. This saving has not been effected upon "food" and "establishment," these items being higher than in the previous year.
- 3. There is a decrease in the gross cost of maintenance of Rs. 29,753. This result is to some extent owing to the falling off in the number of prisoners, in itself a subject of congratulation.
- 4. The value of the prisoners' labour in 1863-64 was Rs. 38,543, from which it has fallen in the year under report to Rs. 11,280, giving less than Rs.  $7\frac{1}{2}$  as the earning of each prisoner, that being less than one-third of the amount earned by each prisoner in the previous year.
- 5. The reasons given by the Inspector General of Prisons for such unsatisfactory results, are the breaking up of two special gangs, and the stoppage of the factory at Kurrachee (where the earnings have been next to nothing) by the outbreak of a severe epidemic at the close of the previous year.
- 6. The above causes would seriously affect the earnings at Kurrachee and the total earnings, but it is disappointing to find that

- e no such causes were at work, each prisoner in the year 1863, when His Excellency in Council report of the Hydrabad jail unsatisfactory in this respect.
- Reform is called for in the Kurrachec jail, where the expenses very heavy, whether they are compared with the previous year's uses, or with those of the other jails for the present year. The f maintenance is exceptionally high.
- 3. In paragraph 130 the Inspector General gives Rs. 16,314 income of the jails from all sources; but it nowhere appears this amount is derived, it being much in excess of the value e prisoners' labour.
- 9. 72 prisoners died during the year, giving a ratio of deaths

  average strength of 4.8 per cent., which is considerably below the
  verage for the last 10 years in the whole Presidency, excepting

  Sind.
- 10. It is no less satisfactory to note that cholera has made no victims, and dysentery, diarrhea, and fever very few in comparison with the previous year
- 11. It appears that the jail at Hydrabad had, during the period under report, become not not only more costly, but far more unhealthy than it was in 1863. The marked unhealthiness of this jail is attributed by the Civil Surgeon to defective ventilation and overcrowding. The Inspector General could not at the date of this report offer an opinion, founded on personal knowledge, as to the possibility of improving the ventilation of the present jail, since his tours of inspection in Sind had not then extended further than Kurrachee.
- 12. There were 100 re-convictions. While admitting the truth of the Inspector General's remark, that it is difficult to reclaim professed thieves, His Excellency in Council notices also, that 97.25 per cent. of the criminal population of the province are totally uneducated. The attempt which has been made at Hydrabad and Kurrachee to educate juvenile prisoners having met with success, might apparently with advantage be extended to the Shikarpoor jail.

- 13. At a time when the Sind jails are so control jail has been decided upon, it does not seem at Excellency in Council to increase the jail establishment at Sax as proposed by Dr. Wiehe at page 59 of the report.
- 14. In paragraphs 81 and 82 Dr. Wiehe remarks, "c escaped convicts during the last two years, 6 only were re-cap and 20 remained at large. This is a large proportion, and the ject demands the attention of the Police authorities." Superintendent of Police should endeavour to trace the pri who remain at large.
- 15. The Inspector General, in his Report dated 27th 1863, represented that the floors of the Shikarpoor jail should re-made, the stones removed, and a smooth mud floor substituted and in consequence it was ordered in the Government Resolutio that the floors should be re-made. The Inspector General should state by whose orders, and for what reason, the tiles complained of by the Civil Surgeon were put down, instead of the mud floor recommended by him.
- 16. The Governor in Council will not, in connection with this report, further remark upon the nature of the statistical tables which it embodies, as that subject has been discussed in a recent Resolution No. 3572 of the 13th November last.

W. WEDDERBURN,
Acting Secretary to Government.

### OF THE

# CORRESPONDENCE ON THE SUBJECT OF LIGHTI THE ENTRANCE TO THE HARBOUR OF BOML

- 1. The subject was laid before Government for consider

  \*No. 129 of 18th June 1860. in a Report\* (which is published in tenso in the next paragraph) from C tain W. C. Barker, Conservator of the Port, in which, after revie ing the existing means for the purpose, he proposed the following as what should be done with respect to the lighting up the entrance to the Harbour:—
  - 1st.—A new Lighthouse, painted white, on the extreme edge of the S. W. Prong. It should have a first class Revolving light, 150 feet above high-water mark.
  - 2nd.—A loftier Flagstaff at Malabar Point.
  - · 3rd.—A new Lighthouse, painted white and red, in horizontal lines, at Kennery. It should have a first class Fixed light, 180 feet above high-water mark.
    - 4th.—A martello tower on the "Sunken Rock," displaying from its summit a Fixed light of the 2nd or 3rd class.
    - 5th.—The inner and outer Light Ships to be then removed.
    - 2. Captain Barker's Report alluded to above is as follows:—
- "I have the honour of submitting the following Report on the Lighthouses, Light Vessels, Beacons, and Beacon Buoys of this Harbour.
- "2. I would premise that I am aware that of late years many and various schemes for the improvement of the Port of Bombay, both with regard to the efficient Lighting and Pilotage as also the Harbour Defences, have been submitted to Government for consideration, but little has yet been done towards carrying into practical effect what every one acknowledges to be so highly necessary.

at the same time aware that, in the present state of mances, it is hardly to be expected that Government will sed to undertake what is recommended in the following nmediately; still I feel it my duty to lay before them what her so essentially necessary for the shipping interests of this numercial Port, and for the benefit of Government.

It is apparent to every one that the Port of Bombay is coming of more importance both politically and commerassessing as it does all the essential requirements for the iment of an efficient Naval Arsenal, and all the qualifications eat commercial Port, capable of being rendered easy of access, rends at all times, whether by night or day, and at all the seasons the year; but at the same time, if not inaccessible, at least very nidable, to enemies. It is in fact the very key to our Indian Empire on the West Coast, and the Grand Depôt for Military Stores, and it is indeed surprising that its great capabilities have not long ere this been more fully developed.

- "5. I propose in the first place noticing the boundaries of the entrance to the Harbour—the Lighthouses, Light Vessels, Beacons, and Beacon Buoys as they exist at present; secondly, to suggest what I consider necessary towards the efficient lighting up of the entrance to the Harbour; and, thirdly, to point out what may be done towards protecting the entrance to the same, and of our mercantile fleet.
  - "6. Kennery or Kundarce Island marks the boundary of the entrance to the Harbour on the south side. It is a small rocky Island, bearing from the Lighthouse south distance 112 miles, and is elevated near 100 feet above the level of the sea.
  - "This is the point all vessels should endeavour to make (especially during the South-West monsoon) in running for the Harbour.
  - "7. To the North the entrance to the Harbour is known by Malabar Hill, with its low insignificant Flagstaff half way down the brow of the hill, and by the Lighthouse. This latter is situated at the extreme south end of Colaba, and is elevated about 130 feet above low-water mark.
  - "The Light displayed is a Revolving Light visible from the deck of a ship, in ordinarily clear nights, about 16 or 18 miles. It is not

easily discernible during the day on account of the and buildings.

"The South-West Prong extends to the South-West Lighthouse, a distance of  $2\frac{3}{4}$  miles, drying at low-water 1 tides to a distance of  $1\frac{3}{4}$  miles.

"8. The Fair-Way to the entrance of the Harbour is by a floating Light Vessel, moored equi-distant about 2 mil the extremity of the South-West Prong, and the foul gro Thull, is seven fathoms at low-water spring-tides. The fare the bearings and distances of the principal points from the Light Vessel:—

Malabar Point Flagstaff N. 4 deg. 50 E. distance 6:90 mile.
Lighthouse, N. 21 deg. to 50 min. E. 4:53 miles.
South-West Prong extremity North, 2 miles.
Inner Light Vessel, N. 38 deg. 50 min. E. 4:68 miles.
Middle of Thull Shoal, E.S.E. about 2 miles.
Kennery or Kundaree Island, S. 14 deg. E. nearly 7½ miles.

- "9. This vessel (built especially for the purpose) took up her station early in 1842, displays a bright Light at her mast-head from sunset to sunrise, is visible 10 to 12 miles from a ship's dock in clear weather; a Blue Light is burnt every hour during the night, and a torch at the half hours. During the day a red ball is shown from the mast-head, and on a sail being signalled a red flag is hoisted.
- "10. Notwithstanding that this vessel is moored with very heavy cables and anchors, she has broken adrift several times (twice during last South-West monsoon). Of course this is more likely to happen in very bad weather, when such a guide to the entrance of the Harbour (more particularly with the Lighthouse in its present position) is most urgently required.
- "11. About & of a mile North-East by North of the outer Light Ship is a large wooden Buoy, which has a spiral top, painted red, called the Fair-Way Buoy; this has also broken adrift several times, and of course is more likely to do so in very bad weather.
- "12. The Inner Light Vessel (an old dismantled Schooner of about 90 tons) is moored to Southward of Sunken Rock, and bears from Outer Light Vessel N. E. ½ North 4½ miles. This vessel has

ignalled at the Lighthouse. About & of a mile to N.N.W. Buoy, marking the exact position of the Sunken Rock. Including remarks of the last two paragraphs are also applitude the Inner Light Vessel and Buoy. The Inner Light Vessel drift once last South-West monsoon.

- 3. Beside the above there is a Beacon (a white stone pillar 4 feet high) on the 'Oyster Rock,' a small Lighthouse Dolphin Rock' displaying a green Light to the Southward astward, and Bright Light to the Northward, dark to the stward. This latter was erected at the close of the year 1856, a strange to say accommodation for the men necessary to keep lamps trimmed was entirely lost sight of in the construction of as building; this is now being remedied.
- "14. The middle ground Shoal is defined by a chequered white and black Buoy to the Southward and a black Buoy to the Northward; both are of Iron.
  - "15. The Flagstaff Shoal by a large red Buoy.
- "16. The Northern patches between the last named Shoal and Cross Island are marked by small Iron Buoys.
- "17. There are also small Iron Buoys, marking the Northern and South-East edges of the Reef off Butcher's Island, and a Buoy marking the position of a small patch of rocks on North-Eastern verge of reef of Caranja Island.
- "18. Having thus described the principle points marking the limits of the entrance to the Harbour, as also the Lighthouses, Light Vessels, Beacons and Beacon Buoys as they at present exist, I will now proceed to show what I consider necessary should be done with regard to so important a matter as the lighting up the entrance to the Harbour.
- "19. Lighthouses should be erected, if possible, on the dangers they are intended to guard against, and not (as is the case with the present Lighthouse at Colaba) two miles and three-quarters within the danger.
- "20. The utility of Floating Light Vessels cannot for a moment be called in question, where the cost is low, and where

sunken rocks and hidden dangers extend a control to seaward; but for this Port they are not only but often mischievous, for, as I have observed before, at the time they are most urgently required, namely, in extreme weather, they are most likely to break adrift.

- "21. Before the present Floating Light Vessels can pensed with, it is necessary to make a radical change in the bad system of lighting up the approach to the Harbour.
- "22. In the first place I would recommend that a Lig be erected on the extreme edge of the South-West Prong, w dries at low-water spring-tides. It should be a first class Revo. Light, and elevated 150 feet above high-water mark, so as to visible from the deck of a ship in clear weather 18 to 20 miles.
- "23. I would also recommend that a loftier Flagstaff erected on Malabar Point, so as to appear well above the trees and buildings in the vicinity. The approach to the Harbour on the North side would then be clearly defined.
- "24. Kennery or Kundaree Island is elevated, as before stated, about 100 feet above the level of the sea on its highest point. I would recommend the erection of a Lighthouse some 80 feet above the summit, or 180 feet above the sea, to show a fixed bright light of the 1st class, so as to be visible in ordinary weather 20 to 22 miles from the deck of a ship. This Lighthouse should be painted in alternate red and white broad bands or belts horizontally. The Lighthouse at the end of South-West Prong should be all white, then there could not possibly be any chance of mistaking one for the other either by night or day.
- "25. A double light on Kennery was advocated by the Committee appointed by Sir Henry Leeke to report on the subject of an improved system of Lighting Pilotage. I do not see the utility of a double light when the latter would answer every purpose.
- "26. The Sunken Rock, I am aware, is very small, but it is by no means impossible to erect a martello tower thereon, which would assist materially in defending the entrance to the Harbour, and at the same time by displaying from its summit a bright fixed Light of the 2nd or 3rd class, so as to be visible 5 of or 6 miles from a

Both Inner and Outer Light Vessels might then be

- 27. Thirdly, with regard to defending the entrance to the our, the intervening space on the South-West Prong, between roposed new Lighthouse and the Southern end of Colaba, in the course of a few years be all reclaimed from the sea, and excellent site for a series of Batteries, which would a greatly to the strength of the Harbour Defences now in a for construction. For the erection of these works we have a materials in close proximity, and let it not be forgotten that thave certain fine weather for at least eight months in the year, at that the works may be carried on progressively and surely.
- Harbour Defences, years must elapse before they can be sufficiently advanced to resist the entrance of a hostile fleet. I cannot for a moment suppose that an enemy's fleet would venture to appear unless assured of the absence of men-of-war sufficient to protect the shipping; but with the present fortifications, a couple of smart Frigates, well handled, could, in my opinion, either capture or destroy the whole of the mercantile fleet with almost entire impunity to themselves as the ships are now anchored.
- "29. I would suggest, in the event of a hostile fleet being expected, that the shipping be moved to the Northward of Butcher's Island and Elephanta Island, and to the deep-water anchorage off the old Fort on East end of Trombay Island; by throwing up Batteries on Butcher's Island, Elephanta, Trombay, and on the Northern end of Caranja, the shipping would thus be completely protected.
- "30. There is smooth and deep water close to the Island of Trombay. By the construction of a few piers on piles or arches, so as not to obstruct the tidal scour, ships might haul alongside to discharge and receive cargo. This spot is only distant from the Railway about 4½ miles. Would not this obviate the necessity for Wet Docks, and be less costly?
- 31. By removing merchant vessels from their present anchorage, the guns on the eastern or Harbour face of the Fort might

then be made available for the defence of the Po. certainly could not be as the ships are now berthed.

- of the total wreck of the American Ship 'Squantum' some 16 miles to the Southward of Kennery (exact particulars no known) which induces me to think that had there been a Lighton Kennery Island, as suggested by me in the 24th paragrap calamity would probably have been averted.
- "33. The crection of a Lighthouse on the extremity South-West Prong could only be carried on during the fine s whereas the erection of a Lighthouse on Kennery Island cout, proceeded with at all seasons. It would therefore be of more a vantage to the shipping interests if the latter was first commenced.

I have the honour to be, &c.

W. C. BARKER, Captain, I. N., Master Attendant and Conservator of the Port.'

- 3. Government ordered the foregoing report to be sent to the Marine.—G. R. No. 580 of Chamber of Commerce for their opinion and suggestions.
- 4. In the meantime Government received a report on the same subject from Mr. Kennelly, dated 5th August 1862, in which the following proposals were made to improve the lighting of the Harbour entrance:—
  - 1st.—To erect a Lighthouse on wrought iron screw piles, in Latitude 18:44:48 North and Longitude 72:41:10 East, to be called the "Bombay Direction Lighthouse." It should have a first class Revolving Light, flashing every 20 seconds, and elevated 100 feet above high-water mark. The Lighthouse to be painted in alternate white and black bands.
  - 2nd.—To shift the outer floating Light Vessel 3½ miles nearer to the Harbour, and call it the "Fairway Light," until it can be substituted by a Lighthouse on piles exhibiting a Fixed light of the 2nd class.

Substitute red shades for the green shades at the Dolphin light.

h.—To abolish the Colaba Light and the Inner Light Vessel.

This report of Mr. Kennelly was also ordered by Government to be sent to the Chamber of Commerce, to be considered along with Captain Barker's report.

In reply, the Chamber of Commerce suggested that Commission of the Government should appoint a Commission to inquire into, and report on the Spect; and a Notification was accordingly issued appointing the low, to assemble and report "on the lighting of the Bombay "Which mark the danger thereof." Captain Barker's and Mr. Kennelly's papers were also to be considered at the same time by the Committee:—

# President.

Captain J. Young, C.B.

# Members.

The Commissioner of Customs. The Master Attendant.
Lieutenant-Colonel DeLisle.
Robert Hannay, Esq.
J. Farrar, Esq.
W. Johns, Esq.
J. Dixon, Esq.

To the above was afterwards added the name of-

# Member.

Mr. Andrew Grant, Agent for Lloyds.

7. The Commission, on the 31st January 1863, reported as follows:—

# Bombay, 31st Jan.

- "From the Commission appointed by Government Rese. No. 907, dated 25th October 1862, to report on the Li of Bombay Harbour, and to suggest improvements Beacons and Buoys which mark the dangers there-
- "To Major W. L. MEREWETHER, C.B.,
  Secretary to Government, Marine Departn
  "Sir,
- "We have the honour to forward the following report on a Lighting of Bombay Harbour, and suggestions for the improvem of the Beacons and Buoys which mark the dangers thereof.
- "We have to recommend the following arrangements being carried out:-
  - " 1st.—That the Lighthouse on Colaba,
  - " The Outer and Inner Light Ships, and
- "The Dolphin Rock Lighthouse be continued in their present position.
- "2nd.--That a Revolving Light of the first class be substituted in the Colaba Lighthouse for the Light at present exhibited, which is only a third class light.
- "3rd.—That plate glass be fitted to the Dolphin Rock Light-house in place of the ordinary window glass now in use there; the colour to be coatinued the same as at present, viz. Green.
- "4th.—In addition to the above, which constitute the whole of the Lights now exhibited, we suggest the erection on the northern part of the Island Kennery of two square Lighthouses, each 80 feet above the summit of the Island and about 180 feet above the Sea. Each Lighthouse to display from sanset to sunrise a bright fixed light of the first class. The Lighthouses to be 130 yards apart, and connected with a wall 20 feet high. The Lighthouses and the wall painted in alternate red and white bands, each band 10 feet wide. The Lighthouses to be north and south of each other.

is the Island Kennery which he sees; with this additation and sufficiently lights we are of opinion that the Harbour will and sufficiently lighted.

wh.—We suggest that two Buoys in addition to those now in placed one on the north-west and the other on the south-west been of Caranja Shoal; the Buoys to be painted black, the north-set Buoy to have the letters  $\frac{c}{N}$  (Caranja North) and the south-west poy the letters  $\frac{c}{8}$  (Caranja South). The letters to be white, to discarguish them from the other Buoys in the Harbour.

"7th.—With reference to Government Resolution No. 1102, dated 15th December 1862, directing us to report on the efficiency or otherwise of the Pilot Establishment for the Harbour, we suggest that a Board be appointed by Government to consist of five persons, of whom one to be the Commissioner of Customs, who should be exofficio President of the Board. Two to be persons possessed of good practicial knowledge of Marine matters; the fourth to be one of the Firm acting as Lloyds Agent in Bombay, and the fifth a gentleman to be selected by the Chamber of Commerce to represent the Mercantile Community. The Board to have full power to make and alter all regulations for the efficient discharge of all duties connected with the Pilot Establishment as well as the control of the Port Fund, provided that such regulations shall first have been submitted to, and obtained the sanction of Government, and that the Master Attendant and Conservator of the Port be the executive and responsible officer for carrying out the regulations of the said Board.

"8th.—As the question of Pilotage will form a part of the Harbour management, and will come under the consideration of the proposed Board, and as the representatives of the Chamber of Commerce express themselves perfectly satisfied, if this Board be ap-

pointed to represent their interests as large payage dues, we do not consider that much good we from summoning and examining witnesses; we the doing so until the sentiments of Government on the subject communicated to us.

We have the honour to be, &c.

J. YOUNG, Captain, I. N., President.

G. INVERARITY, Commissioner of C

R. HANNAY.

A. DELISLE, Lieutenant-Colonel, R.L.

W. C. BARKER, retired Captain, I. N.,

Master Attendar

A. GRANT, Agent to Lloyds.

W. JOHNS.

JOHN DIXON, Surveyor to Lloyds.

J. FARRAR.

N.B.—The President adds this note to record that Captain Barker, Master Attendant, signs the Report on the understanding only that a separate Minute by him, dated 28th instant, is appended, which is accordingly done with supplemental remarks thereon by the other members of the Commission.

J. Young, Captain, I. N., President."

# MINUTE by Captain Barker.

" I am of opinion that the whole proceedings of the Commission should be laid before Government.

" I submit that sufficient reasons are not shown for the rejection

present position ..... 35

of my propositions 1 and 2 for lighting up the entrance to the Harbour, supported as the said propositions are by so large a majority of nautical and experienced men, as shown in the proceedings of the second day's meeting and noted in the margin.

"With reference to my proposition No. 3, 'as to whether or not the Light

Vessels should be retained in their present positions,' there can be

ould be highly advantageous to the shipping them.

would submit with due deference that the Commission have ipplied with the instructions of Government as contained in ition No. 1102, Marine Department, 18th December 1862, ich as 'the inefficiency or otherwise of the existing Pilot is hment' has not been inquired into or reported upon.

It cannot be supposed that any one would be selected for the ant post of Master Attendant and Conservator of this great rial Port without being duly qualified and competent to yout the onerous duties laid down in Act XXII. of 1855 d by the Legislative Council of India, and therefore if it is sessary to have a Board, the Master Attendant and Conservator the Port should be a member thereof.

"The Port Officer at Kurrachee has been recently appointed (vide Government General Order, Marine Department, No. 157, dated 1st November 1832) Master Attendant of that Port and Commissioner in the Marine Department.

"The Master Attendant and Conservator of the important commercial Port of Bombay ought not surely to be placed in an inferior position.

"I am willing to submit to the opinion of the majority of the Commission, that it is not necessary to forward the detailed proceedings of each day, provided this 'Miaute' be forwarded with the report.

W. C. BARKER, Retired Captain, I. N.

Office of the Master Attendant and Conservator of the Port, Bombay, 28th January 1863."

MINUTE of the majority of the Commission on the Lighting of Bombay Harbour on the objections stated by Captain Barker to the Report of the Commission in its present shape.

"1. Captain Barker submits that sufficient reasons are not shown for the rejection of his propositions 1 and 2 for Lighting up

the entrance of the Harbour, and states that the supported by a large majority of nautical and ext.

The question was fully discussed during the sittings of the sion, and Captain Barker then readily added his own voted subject to those of the other members. His dissent at the patime therefore requires explanation, as well as his change of in other respects since the sittings terminated.

- "2. The removal of the present Lighthouse at Collarather the substitution for it of one on the Prongs, was ne by the Commission, Captain Barker included, for the freasons:—
  - 1stly.—It is "unnecessary: the Outer Light Ship, which a commended to be retained in its present position, is quesufficient to prevent ships running upon the Prongs.
  - 2nd/y.—If the Lighthouse is removed to the low-water ma\_ of the Prongs it will still be at considerable distance from the extreme point of the danger it is intended to indicate.
  - 3rdly.—The proposed Lighthouses on Kennery, which under any circumstances are indispensable, and the retention of the outer Light in its present position will, with the existing Lighthouse at Colaba, amply and safely define the entrance into the harbour:

and such being the case, it was held to be unwise to move to another and a new spot a long-established and well known Light, not to speak of the enormous expense which would, in the opinion of the Commission, be thus needlessly entailed upon Government by the removal of the present Colaba Lighthouse to the site proposed by Captain Barker.

- "3. Captain Barker agrees with the other members of the Commission as to the retention of the Outer and Inner Light Ships and of the Dolphin Rock Lighthouse in their present position.
- "4. Captain Barker submits that the Commission have not complied with the instructions of Government as contained in Resolution No. 1102. The Commission in their Report have given their reasons for this, and it will rest with Government to determine whether the inquiry ordered shall still be carried out.

the proposed Board for making and altering regulative efficient discharge of Port and Pilot duties. The proposed Board for making and altering regulative efficient discharge of Port and Pilot duties. The proposed Board and Pilot duties is not desirable paster Attendant should be both a member of the Board as the executive and responsible officer for carrying out their ions and instructions. The Board will always hope that the Cer so appointed by Government will retain their conficients, he will invariably receive their support, and the Board fail to seek his advice and assistance on every requisite in.

- \*6. The detailed proceedings of the Commission are available Sovernment desire to peruse them.
- "7. Captain Barker, during the Commission's proceedings, admitted the superior advantage of a double light on Kennery over a fixed red light, but now again starts his previous opinion that a double light is unnecessary, and that a single red or bright light would be more suitable To this the majority of the Commission have to urge that the object of having a double Lighthouse on Kennery is to enable the Muriner by day or by night to determine at once that it is the Island of Kennery which he sees; this the double Beacon will ensure by day and the double Light by night, and there will be no possibility of the Lighthouses on Kennery being mistaken for the single one at Colaba. A Beacon exact in size and form with that of the Colaba Lighthous, was erected on Kennery in 1852, and at the very commencement of the first monsoon it led to the wreck of the slap Christian, and was blown down by order of Government to prevent further disaster. the majority of the Commission consider a sufficient commentary on any renewed proposition for a single Lighthouse on Kennery.
- "8. On the subject of a single Red light on Kennery having, as Captain Barker states, been supported by a large majority of nautical and experienced men, the other members of the Commission have only to add that the proposal for a double fixed light on Kennery was not circulated for opinions in the harbour or else-

where; the Commission did not consider it necessand had they done so, they have no doubt the prophave taken precedence in public opinion of all those noticed Master Attendant.

J. YOUNG, Captain, I. N., President., G. INVERARITY, Commissioner of Corn. HANNAY.

A. GRANT, Agent to Lloyds.

W. JOHNS.

J. DIXON, Surveyor to Lloyds.

A DELISLE, Lieutenant Colonel, R.E.

J. FARRAR."

- 8. On receiving the above report Government desired the

  Commissioners to report further whether they consider any substitution of a Light14th February 1863.

  They consider any substitution of a Lighthouse on the Prongs for one at Colaba objectionable in itself, or merely not worth the expense; and to state more fully the grounds of their objecting to the Master Attendant having a seat on the Board proposed by them; and Government ordered a copy of the Commissioners' report to be sent to the Chamber of Commerce.
- 9. The following papers were laid before Government subsequent to their disposal of the Report of the Commissioners, and they are now printed in full for greater clearness as to the opinions expressed in them:—

### " No. 20 of 1863.

The Secretary to the Chamber of Commerce,

If Clajor W. L. Merewlther, C.B.,

Acting Secretary to Government, Marine Department,

Bombay.

Bombay Chamber of Commerce,

Bombay, 25th February 1863.

Sir,

By direction of the Committee of the Chamber of Commerce,

A have the honour to acknowledge receipt of your letter No. 155 of 1863, dated 14th February.

- "The Committee of the Chamber of Commerce having carefully considered the Report on the Lighting of the Bombay Harbour, &c.. concur in the opinions expressed by the Commission.
- "They consider that with a double Light on Kennery, and the present Lighthouse at Colaba made one of the first class, it would be unnecessary, as well as unadvisable, to remove the present oldestablished Light.
- "The proposal for a Harbour Board originated with the Committee of the Chamber of Commerce; they consider that a Board such as the one proposed would strengthen the hands of the Master Attendant, but they are of opinion that it would be far from desirable to have the executive officer a member of the Board sitting as it were in judgment on his own actions.

I have the honour to be, &c.

H. Brooke, Secretary."

"From the Commission appointed to consider the Lighting of Bombay Har

"To Major W. L. MEREWETHER, C.B.,
Acting Secretary to Government.

Bombay, 27th February 186

SIR,

- "In reply to your letter No. 155 of 14th instant, we have honour to inform you that we consider the substitution of a Lig. house on the Prongs for the one at present on Colaba unnecessa for the following reasons:—•
  - "The proposed double Light on Kennery.
  - "The present Colaba Lighthouse.
- "The Outer and Inner Light Vessels in their present position clearly and simply indicate the passage into the Harbour, a simple straight course from the Outer to the Inner Light Vessel leading ships safely into the Harbour.
- "The erection of a Lighthouse on the Prongs will not obviate the necessity of a Light in the position of the present Outer Light Ship, there being dangers eastward of a straight line from the proposed Lighthouse on the Prongs to the Inner Light Vessel, which do not exist in a straight line from the Outer to the Inner Light Vessels.
- "The Commission would not be justified in recommending the enormous outlay that would be required for the substitution of a Lighthouse on the Prongs for the one on Colaba, unless some good would be likely to result from it, the probability of which is not apparent. The expense of its construction has so far deterred the majority of the Commission from recommending it.
- "The Commission do not think that the erection of a Lighthouse on the Prongs would be likely to lead ships into danger, but the necessity for it is not seen.

ce to the 2nd paragraph of your letter under jority of the Commission object to the Master Athaving a seat at the proposed Board, because he being the ve officer for carrying out the rules and regulations of the would have to deliberate and vote on his own actions and ct.

The opinion of the Commission as herein expressed, regarding ostitution of a Lighthouse on the Prongs, is concurred in by members excepting Captain Barker; that regarding the obothe Master Attendant having a seat at the proposed Board excepting Captain Barker, Lieutenant Colonel DeLisle, and ain Johns.

We have the honour to be, &c.

J. YOUNG, Captai ., I. N.

G. INVERARITY.

J. FARRAR.

R. HANNAY.

J. DIXON.

W. JOHNS.

A. GRANT, Agent to Hoyds.

A. Dillishe, Lieut.-Colonel, R.E."

REMARKS by Captain Barker on the Minute of the Majority of the Commission on his Minute forwarded with the Report, and also on Captain Young's Remarks on the Acting Secretary to Government letter in the Marine Department No. 155 of 14th February 1863.

The several paragraphs of the minute of the majority are commented upon as follows:—

- Para. 1. "This statement is quite correct. My propositions 1 and 2 were supported by a large majority of nautical men; I did not readily add my vote to those of the other members, but merely yielded to the majority.
- Para. 2. "In this I yielded, being in the minority; but I would observe that it has been fully proved by the many wrecks and dis-

asters we have had to deplore of late years the Vessel is not sufficient to prevent vessels running up?

- Para. 3. "By removing the Lighthouse to the extreme the Prongs, as suggested by me, it will be 14 miles new the danger it is intended to indicate than it is at present, stand out in bold relief from the land, and can be approach within 4 to 1 mile; at present it cannot be approached to 24 miles from seaward.
- Para. 4. "One Lighthouse on Kennery would answer desired purpose, provided the Lighthouse at Colaba was 1 to the end of the S.W. Prong, and would amply and safely the entrance to the Harbour (even should the Outer Light Vebreak adrift, which has occurred several times). The expense removing the Colaba Light I consider the Commission had nothing whatever to do with, that being a matter for the Government decide upon.
  - Para. 3. "This is quite correct.
- Para. 4. "I still retain the same opinion that the Commission have not complied with the instructions of Government, as laid down in Resolution No. 1102. The reason given by the Commission for not adhering to the instructions I do not agree with.
- Para. 5. "If a Board is necessary, which I do not think it is, the Master Attendant and Conservator of the Port should be a member thereof. Act XXII. of 1855, framed by the Legislative Council of India, confers certain powers on the Master Attendant and Conservator of the Port entitling him thereto.
- Para. 6. . I am of opinion that the proceedings should have been sent in without wanting to know whether Government were desirous or otherwise of receiving them.
- Para. 7. "There cannot be the slightest doubt that two bright Lights would show better than one Red Light. The object in my recommending a Red Light was to render the Kennery Light as distinct as possible from the Colaba Light; but this is a mere matter of opinion. The double Light on Kennery I do not think at all necessary. The latter part of this paragraph I hesitate not to state is a mistake. The Beacon on Kennery Island was as different

- nouse is a round building perfectly smooth and chuwhite, has a dome with platform and a rail flagstaff which
  widerably above the dome, two signal yardarms, and all the
  maces belonging to a Lighthouse, whereas the Beacon on
  cary on approaching from seaward had the appearance of being
  pur-sided, tapering to the top, of rough stone of a darkish tinge.

  nonmission advanced one solitary instance of a vessel having
  nupposed to be lost through the Beacon being erected there,
  the have proof of many having been lost for the want of a
  tuishing mark.
- Para. 8. "At the first meeting of the Commission a Secretary s appointed who was authorized to get the several propositions improving the Port printed and circulated. Twenty-five pies were printed; each member of the Commission was furnished with a copy; the other copies were circulated amongst the shipping. The second meeting of the Commission was deferred to allow time to circulate and to obtain the opinion of nautical men thereon.
- "A long interval was allowed to clapse between the first and second meetings of the Commission for the express purpose of circulating all the propositions relative to the improvement of the lighting up the entrance to the Harbour, &c., and the said papers were duly circulated by the Secretary, and the Commission were informed thereof.
- "I am therefore at a loss to understand the assertion contained in the latter part of this paragraph.
- "In conclusion I would observe that the great advantages to be derived by moving the Light on Colaba to the extreme end of the Prong, retaining the Outer Light Vessel, and building a Light on Kennery, are as follows:—
  - · Vessels coming from the southward—
- "Outer Light Vessel and Lighthouse on the Prong in transit puts the Mariner on the edge of Kennery Flat, and therefore is a guide on approaching that danger;
  - "Vessels coming from the northward-

"Onter Light Vessel in transit with Light will take vessels well clear of the foul ground off the

W. C. BARKER, Retired Captain, H. M. I. N.,
Master Attendant and Conservator of the

Lennery

Bombay, February 1863."

10. A copy of all the foregoing papers were ordered a Marine—No. 517 of 14th vernment "to be transferred to the May 1803. Works Department, with a view ment of the following proposals of the Commission:—

"The substitution of a first class Light at the Colaba Lightle

"The fitting of plate glass at the Dolphin Rock Light.

"The construction of Lighthouses at Kennery.

"As respects the dissent by Captain Barker, the Mastern Attendant, on certain points, Government saw no reason to doubt the soundness of the opinion of the majority, excepting perhaps on the one point of removing the Colaba Lighthouse to the Prongs."

"The arguments show that the Prongs would be the better "position irrespective of expense. The expense may be greater "than the amount of improvement would warrant, but it is worth "while to know what that expense would be. Captain Barker "should place himself in communication with the Engineer of the "Harbour Defences, and learn what might be the probable cost of "the measure."

11. A copy of all the papers was sent to Her Majesty's Marine.—Despatch No. 66 Principal Secretary of State for India on of 3rd June 1863. 3rd June 1863, with a recommendation that the same may be submitted to the Hydrographer to the Admiralty.

Marine.—Despatch No. 39 the Secretary of State on the 22nd June 1863.

12. A further despatch was sent to the Secretary of State on the 22nd June 1863 as follows:—

"We have the honour to submit the accompanying copies of proceedings taken with a view to better lighting of Bombay Har-

bour, attention to the proposals of the Commission as for due inquiry.

- i 2. The principal proposals are the substitution of a 1st class i at the Colaba Lighthouse, and the construction of Lightes on Kennery Island. In order to carry these into effect we so ask your assistance in procuring the Lights.
  - 73. For making the specification for these Lights we respectreggest that the services of the Engineer to the Trinity Board
    region, and that he be authorised to contract with the most
    fd maker for the supply.
- idroptric Holophotal Light of the 1st order. It has to show of sea horizon, and the time of flash should be as long as can arranged, so that in the thick weather of the monsoon it may be more visible than a quick flashing one would be.
- "5. The fixed Lights for Kennery Island will require 200° of sea horizon. The Island is 100 feet above the sea; it is proposed that Lighthouses 80 feet high be erected from which these Lights should be shown.
  - "6. The Engineer's opinion might also be asked as to the distance they should be apart to secure their showing double at 20 miles distance throughout the semi-circle to seaward, and whether it be necessary that these Lights should also be of the 1st order.
  - "7. The cost of these Lights will be defrayed from the Bombay.

    Port Fund."
  - Marine.—No. 88, dated 31st August 1863.

    13. The following reply was received from Sir Charles Wood, dated 31st August 1863:—

"Prior to the receipt of your Marine letter dated the 2nd of June last, No. 39, in which you have asked my assistance in procuring certain lights with a view to the better lighting of Bombay Harbour, the enclosures to your letter of the 3rd idem, No. 36 (which are the same as those subsequently forwarded with the letter No. 30) had been transmitted to the Lords Commissioners of the

Lydro

Admiralty, to be brought to the notice of their by grapher in accordance with your recommendation.

Dated 8th August 1863.

Dated 28th July 1863.

Copies of that report, and of a Memorandum by Captain S R.N., CB., the adviser of the Dated 8th August 1863.

The Board of Trade from which will observe that the Lords Commission of the Admiralty referred the question to that Board, tog with a report from their Hydrog upon the proceedings submitted by R.N., CB., the adviser of the of Trade in Lighthouse matters, an furnished to you herewith.

- "3. Having considered these papers in Council, I am opinion that it will be better that I should not take any steps t wards complying with the requisition conveyed in your letter. No. 39 until you shall have had the advantage of perusing the professional remarks contained in those papers, and the opportunity of possibly modifying the view you had previously formed with respect to the number and nature of the Lights required.
- "4. I shall therefore await a further communication from your Government upon this important subject, in which communication I request to be afforded the fullest possible information in this country in giving complete and speedy effect to the final decision at which you may arrive for the better lighting of the Harbour of Bombay."

"To the Under-Secretary of State for India, India Office, S. W.

"SIR,—I am directed by the Lords of the Committee of Privy Council for Trade, to acquaint you, for the information of the Secretary of State for India in Council, that the Lords Commissioners of the Admiralty have forwarded to this Department, for the information of the Board of Trade, the printed copy of proceedings on the subject of the Lighting, &c. of Bombay Harbour, received by them from the India Office, also a report from the Hydrographer of the Admiralty on the subject.

understand that these papers were sent by the the Admiralty in compliance with a wish expressed Bombay Government.

My Lords have referred the papers to Captain Sulivan, R.N., dviser in Lighthouse matters, and direct me, in transmitting (enclosed) the report from the Hydrographer of the Admi-bove referred to, to transmit also the enclosed Memorandum ptain Sulivan.

gi ne

I have, &c.

W. D. FANE.

Office of Committee of Privy Council for Trade.

Marine Department, Whitehall, 8th August 1863."

#### LIGHTING THE APPROACHES TO BOMBAY.

"Although the India Board, when requesting in this letter 'the notice of their Lordship's' Hydrographer' to the proceedings on the lighting and pilotage of the Port of Bombay, might not have been aware that these subjects are now turned over to the Board of Trade, their Lordships might consider the following brief remarks on the former of these subjects as not unworthy the attention of that Board.

"The natural formation of the coast land about Bombay in the low character of Colaba Point, the shoal approaches to the shore immediately to the southward, and the receding position to this land itself, all contribute to render the question of lighting the approaches to Bombay, in a manner satisfactory to the seaman, a subject for very careful consideration.

"The full measure of difficulty arising from this condition of coast about the mouth of an important Harbour is mostly found by seamen in the S. W. monsoon. Arrived there in foul weather with a strong gale when the kind is concealed by mist or rain, and the shoal flat approach abovementioned is a wide waste of broken water, with his lead as his only guide, it is then that the absence of some off-lying islet with a beacon on it is keenly felt, and then that

between the squalls of rain when attempts have the land that ships have been irretrievably lost.

"Still Bombay is not a Harbour the approaches to should be allowed to remain in their present condition; the importance of its position, its depth of water, large extent and nection with interior navigation, along with its great securishipping and capabilities of improvement in regard to the rements of a first-rate mercantile Harbour, point to it as a pli immediate attention where improvement should at once be earnest.

"Looking then on Bombay in this light, attention mube directed to its approaches from sea. The principal want a is evidently an outlying Beacon to apprize the mariner of his promity to the Harbour, and the first thing to be done is to avourselves of the most outlying land for that purpose. That wou evidently be Colaba Point, which would give a position for a Lighthouse about a mile and a half to the S. W. of the present light, and assuredly this is the site on which this light should have been erected.

"Colaba Light in this position would there be on the most salient point (as it should be) of the coast, and would be most favourably placed for being seen by vessels approaching the Harbour. It should be a revolving light as at present, but instead of the unreasonable interval of  $2\frac{1}{2}$  minutes of darkness its period should not be more than half a minute (or even less), and it should have an horizon of 21 miles distance, and should be one of the best possible lights that could be procured.

"The present arrangement of an outer Light Vessel in the fairway of the entrance should be preserved, and the utmost pains should be taken, by giving her strong ground tackle, to enable her to keep her station in all weathers, and to prevent that breaking adrift which has occurred at a time when the assistance of her light is most wanted.

"The position of this Light Vessel would be about  $2\frac{1}{2}$  miles South by West of the site of the new Lighthouse on Colaba Point, a position but little in advance towards the offing. But in addition to her light if she could be provided with a steam whistle, such as

ge Island Lighthouse in the bay of Fundy, she is the warning to vessels six or seven miles in the offing a the wind's eye of her. This in the bad weather of the Amonsoon would be invaluable, and no pains should be spared p this apparatus in efficient working order, as it would be an all safeguard for vessels that make direct for her in foggy or.

PStill in ordinary bad weather it also appears desirable that bound to Bombay should have a warning of their approach nt lace outside of this light. It has been proposed to place house on piles about 7 miles S. W. of the present Colaba 'Chouse. This would be an experiment which might or might a succeed. A vessel even running foul of it might place the It has been be to be fatal. · less dangerous 'method, and one by no means so expensive, would be to moor a ball beacon (not so far out) such as is in use at a place called Spaner's Spit in the rock channel at Liverpool. This beacon, formed by a small vessel of compact shape, sharp at both ends, and decked over to keep out the sca, securely moored with heavy ground tackle in 6 fathoms water, carrying her ball at a moderate height, might ride well even when the Light Vessel had parted, and if she too should break adrift, would only cost the trouble of being replaced.

"In the dark rainy and misty weather of the S. W. monsoon such a beacon might guide vessels bound to the Harbour of Bombay to the position of the Light Vessel, and eventually enable them to enter it.

A. B. Becher, For Hydrographer.

Hydrographer's Office, 28th July 1863."

# MEMORANDUM BY CAPTAIN SULIVAN, R.N., &

"If in the first place the question of expense is set aside, I no hesitation in recommending the plan of Captain Barker, w founded on the following and now well established rules for 1 lights:—

- 1. The light should be as near as possible to the dance
- 2. Where practicable a Lighthouse should be preferre Light Ship.
- 3. A single light distinguished by its character should used in preference to the now obsolete plan of doul fixed lights.
- Vessels, as recommended by Captain Barker, the Colaba Light should certainly be placed on the extreme of the Point at low water, or as near it as a safe foundation can be obtained. If that cannot be found, a screw-pile Lighthouse would, I think, answer for that position. It should be a first order revolving light of one minute interval, and not less than 100 feet above high-water.
- "3. If a Martello Tower were erected on 'Sunken Rock' it would be in an admirable position for the defence of the Port, and a light on it would have the great advantage over a Light Vessel of enabling a band of coloured light to be used to guard vessels from the dangers outside; and thus with the better position of the Colaba Light, both Light Vessels might be dispensed with. Even if the Martello Tower were not built, it might be worth erecting either a pile or stone Lighthouse on the rock, and shifting the position of the Colaba Light in order to save the cost of two Light Vessels. But if neither of these plans is adopted, both Light Vessels should be retained as recommended by the Commission, and the removal of the Colaba Lighthouse would then be of less importance.
- "4. Both the Commission and Captain Barker agree that it is important to place a light on Kennery Island, and of this there can be no doubt; but the Commission think it necessary to distinguish

me that by two lights. This is quite unnecessary, even reason of a fixed light in the Outer Vessel prevents a fixed leing placed on Kennery Island. One of the best and most tive lights now used is a flashing dioptric light of 10 seconds al. It cannot possibly be mistaken for a revolving dioptric vith an interval of a minute; where not absolutely necessary inction, no dioptric revolving light should have a longer interval one minute, as the period of brightness is so short in ghts compared with that in the old catoptric revolving lights, halong interval they are more difficult to make out.

The flashing 10 seconds light should be placed on Kennery Island of h preference to the two lights recommended by the Commission, the Island is 100 feet high, a Tower of 50 feet would be sufficient, unless trees which cannot be cut down require a greater height, as there is no advantage in having the light more than 150 feet above the sea. The shorter Tower would prevent its being mistaken for Colaba, and for greater distinction one should be painted with verticle red and white stripes, and the other with horizontal ones.

- "6. There is another arrangement of the lights which would equally answer the purpose, and would make the floating light more powerful if that is considered desirable.
- "7. It is to make the outer floating light a minute revolving light with three reflectors on a face, such as are used in several new Light Ships in this country. Then the Colaba Light should be a 10-seconds flashing light, and Kennery Island a first order fixed light.
- "8. It might be difficult to alter the Colaba Light to a first order, as a lantern 13 feet diameter is required, and the Tower may not be large enough; for a second class light a lantern of 10½ feet only is required, and as the dioptric lights have now been so much improved, a second order light might be sufficient. The revolving and flashing lights of the second order are more powerful than fixed lights of the first order.
- "9. The danger of the Light Vessel driving might be lessened by having a set of mushroom moorings and chains, such as are in use by the Trinity House, sent from England.

"10. The estimates given in the papers for pile Lighthouses are far less than their cost has been and this country.

B. J. Suliva.

Board of T

8th August 1863.

- 14. The Government of Bembay ordered that copies foregoing papers, from the Se of State, should be sent to the Board.
- Marine.—No. 106 of 10th Harbour and Pilotage Board to so the correspondence on the subject lighting the Harbour to Mr. Parkes, C.E., at Kurrachee, for the gentleman's opinion as to the exact position and construction of any additional lights which may be requisite to carry out the views of Captain Barker. So far as they are supported by the opinions expressed in the accompaniments to the Secretary of State's Despatch (see paragraph 13 ante) Mr. Parkes was also to state probable cost of such Lighthouses, and the course he would propose to ensure their early and effective completion.
  - 16. The reply of the Harbour and Pilotage Board, and Mr. No. 44 of 25th April 1864.

    Parkes' report which they handed up, are given below in full:—
  - "To the Secretary to Government.
- "Sir,—We have had under consideration the letter from the Right Honourable the Secretary of State for India, No. 88 of the 31st August 1863, with its accompaniments, in connection with the improvement of the Lights of the Harbour of Bombay, and after due deliberation, beg to state, for the information of His Excellency in Council, that notwithstanding the decision come to by the Pilotage Commission appointed by the Government of Bombay, under Notification of the 25th October 1862, that a removal of the present Lighthouse at Colaba is not called for, and although great consideration is due to the view thus expressed,

pears to be a large preponderance of opinion volume are removal of the Lighthouse from its present position edge of the danger, or as near thereto as practicable, not mong the highest authorities in England, but also among onversant with such matters on the spot, we would not be do in recommending to the Government to carry out the roposed by the Commission, so far as regards the Colaba and would suggest that the Light be removed from its position to the extreme edge of the South-West Prong, a dries at low-water spring-tides or as near thereto as safe tion can be found.

inicated to us in Secretary Lieutenant Colonel Marriott's letter 1. 106, dated 10th February 1864, we have been in communication with Mr. Parkes, C E, during his recent short visit to Bombay, and have been favoured by that gentleman with a report which we now submit in original.

- "3. In this report it will be seen that Mr. Parkes advocates a single Lighthouse at Kennery, the buildings to consist of a central Tower 80 feet high, and at a distance of 50 yards North and South, Light-keepers' dwellings connected with the Tower by crenellated walls. The Tower to exhibit a single light flashing every 10 seconds; or supposing the outer Floating Light could be made red, without objection, it is suggested that Kennery be then made to show a bright fixed light. This opinion coincides with that seconded by Captain Sulivan.
- "4. Mr. Parkes further advocates the substitution of a Light on the Prongs in place of the present Colaba Lighthouse 1½ mile from the present Lighthouse and 1½ mile from the deep-water Channel. He estimates the cost of this Lighthouse at £24,000, which amount we fear will eventually be found much within the necessary outlay. The substitution of a Tower in place of the present Inner Light Vessel he leaves to be determined by the local-authorities.
- "5. A light flashing every 10 seconds possesses doubtless a marked distinction over one that revolves once only in a minute, and the difference in ordinary times would be easily detected,

in stormy weather, and that therefore the distinguis a double fixed bright light at Kennery is indispensable. Mor care must be taken that the light be not capable of confusion the jungle fires on the hills in the back ground, and the effections of the best be secured by the double fixed light remembed.

- "6. We have not yet been able to obtain an estimate probable cost of erecting the proposed double Lighthon Kennery, but as there is a large quantity of good stone island, and no engineering difficulties to contend with, we be the cost would not be very great, and as we consider it of utmost importance that this work should be undertaken immedately, we beg to urge on Government the necessity for an ear decision being arrived at respecting it. Whether the Colaba Lighbe ultimately removed or not, all parties are agreed upon the necessity of a Light on Kennery, and no reason now exists for the erection of the latter not being forthwith sanctioned and commenced.
- "7. As the Port Fund is not in a condition to bear the cost of the proposed Lighthouses, we solicit the aid of Government towards defraying the same, and are confident that in a work of such national importance this aid will be readily given.
- 8. The substitution of a Tower Lighthouse on the Sunken Rock can be hereafter considered as soon as the work has been decided to be feasible, and its probable cost ascertained; there is no immediate necessity for the alteration in this respect suggested by Mr. Parkes."

## REPORT OF WILLIAM PARKES, C.E., ON LIGHTING THE APPROACHES TO THE PORT OF BOMBAY.

Bombay, 28th March 1864.

- " To the SECRETARY HARBOUR and PILOTAGE BOARD, Bombay.
- "SIR,—In compliance with your instructions to me forwarded upon a letter from the Secretary to Government to the President

the honour to report to you the result of my investigation.

It is not within my province to discuss the various nautical baents which have been brought forward.

I conceive that the principles laid down in the Memorandum train Sulivan, the highest authority of the day in Lighthouse is, may be taken as established, and it only remains for me is to out how, and to what extent, they may be carried out.

The recommendations to which these principles lead are—

- 1. A powerful sea light on the Island of Kennery.
- The removal of the Colaba Light to the most southerly is Lacticable position on the South-West Prong.
  - ' III. The substitution of a Lighthouse on the Sunken Rock for the Inner Light Vessel.
  - "With regard to the first of these points little need be said. The Island consists of two knolls, the southernmost of which is rather the higher, but does not present sufficient surface for buildings of such a distinctive character as is required.
  - "The northernmost knoll is in every way suitable for the purpose, and I would recommend that the buildings consist of a central tower 80 feet high, and at a distance of 50 yards north and south, light-keepers' dwellings connected with the tower by crenellated walls. This will present a range of buildings towards the sea, which during the day will enable the seaman at once to identify his position.
  - "At night a light flashing every 10 seconds will give a marked distinction from any other light in the neighbourhood, or if it should not be thought objectionable to make the outer Floating Light red, the Kennery might be a bright fixed light. This would effect an economy of about £1,000.
  - "On the other hand the objection to establishing a new fixed light so near to the other Outer Light Vessel, where one of a similar description has been long in action, should have its full weight. The decision of this question should be left to the nautical authorities.

simple and inexpensive operation. The island confidence of suitable stone ready quarried, good supply of fresh water. There is landing on the easter in all weathers.

given much consideration to the matter, and have furnished with some details of the special requirements for a Light He will submit to Government a design for the buildings, exing the general features we have together determined control buildings in a similar situation off the coast of England wou from £3,000 to £4,000, and the lantern, light apparatus, and codetails sent from England, and their erection, would cost un £4,000 or £5,000 in addition according as the light be fixed flashing.

"The removal of the light from Colaba Point to the Prongs is a more complicated question. I visited the proposed site in company with Captain Barker and Colonel Jones, and a spot was found suitable for the foundation 1½ mile S. W. from the present Lighthouse, and ¾ mile from the deep-water channel off the end of the Prong. It would of course be practicable at a greater expenditure of time and money to place a light upon a site still further seaward, though I was informed that the site we visited was the outermost piece of solid rock; but even if time and money were not considered, I doubt if much advantage would be gained by going further out. There can be no doubt that the proposed site would be a great improvement upon the present site, and if it do not fulfil all the requirements of the optimist, I think it would be a great practical boon to the navigator.

"Colonel Jones and myself have conferred together upon the mode of construction, and he will submit a design based upon a Sketch I prepared, and which he approved, for a Stone Lighthouse, in which the light will be 150 feet above low water, or 18 feet higher than the present Colaba Light. I may state that the peculiarity of this climate offers a great advantage over that of Eugland for the construction of all works within range of the tide. Though during the four months of the S. W. mensoon the work must be ex-

to the of sea, yet during the remaining eight months yet the or no dauger or interruption to the work is to be ted, and consequently the precautions which are necessary teoast of England to secure against a storm which may come need only be taken once a year at Bombay. This simplity work materially, dispensing with all those ingenious but contrivances for locking and dovetailing the stones together care sometimes assumed to be an essential feature of Light-transtruction, but which are really unnecessary except where while in progress is liable to be acted on by heavy seas.

The light should be a holophotal dioptric revolving one of the 'Ed order,\* showing a flash once a minute. This as well as the sern (of gun metal), the top gallery and floors of cast iron, and 'I stairs of wrought iron, should be manufactured in England. The stairs of these portions of the work, including freight and erection, would be about £4,000, but I should state that this estimate, as well as that for the corresponding articles for Kennery, is only approximate. To make an exact estimate it would be necessary to refer to documents which I have not with me. Of the cost of masonry Colonel Jones will furnish an estimate. The cost of a similar Tower on the English coast, where suitable to a could be obtained as near as Bombay, would be probably £20,000, or, including the £4,000 above named, £24,000 for the complete Lighthouse.

"In order to carry out this work quickly and conomically the first requisite is an experienced practical foreman. Europ an or native) to superintend the landing and placing of every stone, and a small but efficient staff of workmen, the whole of whom should be irremovable from the work by any other authority but that of the Engineer in immediate charge. I expect that four seasons will be occupied with the work, but with a good and permanent staff it will progress steadily and without drawbacks, becoming also as it increases in height more and more valuable as a day beacon during thick weather. When completed it will be a structure worthy of

<sup>\*</sup> Ceptain Sulivan suggests that it should be of the first order, and before the second order is adopted the matter should be referred back to him with the suggestion that two first order Lights so close together as Kennery and the Prongs would be are unnecessary.

the approach to such a Port as Bombay, which to Lighthouse certainly cannot, so far at least as \* its concerned, be considered.

- "With regard to the third point, the erection of a Light on the Sunken Rock, to replace the Inner Light Ship, I can but little. The tides during my stay at Bombay did not give opportunity of examining the rocks, so I can give no opinior building upon it. Should the Prongs Lighthouse be exerthe Engineer in charge will obtain a special and local experiments which will make him a better judge in the matter than I can
- "Even if commenced a year later it might probably be far as soon, or nearly as soon, as the Prongs Lighthouse, and Cap. Sulivan's suggestion, that by the employment of direction beams colour from the Sunken Rock light the Channel might be so we marked as to dispense with both Light Ships, be carried out simultaneously with the exhibition of the new Prong's light. This, however, is a nautical, rather than an engineering question, and I allude to it only to show how the whole system may be brought to bear if approved by the nautical authorities. The establishment of the Prong's light, however, I take to be a question independent of any possible future change in the floating lights, and connected with the latter only so far as it will facilitate that change if on other grounds it be considered desirable."
- Marine.—G. R. No. 337 of 17. The orders of Government on the above were as follows:—
- "Beside the Port Fund, the Pilotage Receipts have been placed at the disposal of the Harbour Board, and these have hitherto exceeded the expenditure by above Rs. 50,000 per annum.
- "If the cost of the Kennery Lights cannot be defrayed therefrom, the matter must be clearly explained for the satisfaction of
  the Government of India.
- "The Government would of course be willing to advance the money, if necessary, on a clear understanding of repayment by instalments.
- The Government quite agrees in the proposal to build the double Lights at Kennery Island, and to remove the Colaba Lighthouse to the spot indicated in the Board's letter."

18. Harbour and Pilotage Board addressed the following representation to Government:—

With reference to the Government Resolution No. 337 of the valtimo, the Bombay Harbour and Pilotage Board request the of an intimation of the measures which are in progress for rucing the new Lighthouses at Colaba and Kennery, and for the work to an early completion. The Board regret to that it is in contemplation the works should be executed from at present at their disposal, as these are quite inadequate at the outlay, nor have the Board any authority as a corporate to raise money by loan for the purpose upon the future reverees of the Port Funds.

- The Board are of opinion, as a large surplus has for many Jears past been derived from Pilotage, and from those sources of Harbour revenue which existed before the Port Funds Act was brought into operation, and which surplus it is possible may have from time to time been credited to the Imperial Revenues, that the cost of the new works may with propriety be devolved upon the State, to be defrayed out of profits which have so accrued; otherwise the Board do not see how the Lighthouses can be constructed, for it is within the recollection of His Excellency in Council that the whole balance of the Bombay Port Fundup to the close of 1862-63 has already been appropriated by Government in anticipation of the reclamations at Modee Bay, and to require the Harbour Board to construct the new Lighthouses out of the current revenues of the Fund would be simply to defer for several years the completion of works which have been on all sides unanimously pronounced to be of the most emergent necessity.
- "3. Should Government nevertheless be of opinion that the current revenues of the Port Fund should bear the cost of the new Lighthouses, the Board request the favour of being informed in connection with paragraph 1 of this letter of the officers by whom the estimates are being framed, the probable amount of the latter, and the amount of the annual instalment which the Board would be expected to pay back in liquidation of any advance which Govern-

ment may be disposed to make in order to see commencement of the work.

nmediate

"4. The Board in conclusion beg to lay before Gover their opinion that it is desirable the whole unclaimed Forest the Harbour should be placed at their disposal for the ben Harbour Improvements, as is the case under similar circum throughout the United Kingdom, and solicit that the necess structions to this effect may be issued."

Marine.—G. R. No. 457 of And Government issued on the 28th June 1864. the following orders:—

"To the request now repeated that the cost of the K
Lights should be defrayed from Imperial Funds, because of the
sufficiency of the Port and Pilotage Funds, the Government
only reply as in the Government Resolution No. 337 of 13th M
that the insufficiency must be clearly explained for the satisfaction
of the Government of India, without whose sanction His Excellency
in Council has not authority to comply with the request.

- "2. The Public Works Department will now be requested to prepare plans and estimates of the Kennery Lights, and when the probable cost is known, the means of execution will be reconsidered.
- "3. As respects the removal of the Colaba Lighthouse, the 6th paragraph of the Board's letter, No. 44 of 25th April, suggested the postponement of that work until the completion of the Kennery Lights. But the Public Works Department will be requested to prepare an approximate estimate sufficient for decision as to the means of execution.
- "4. The request that the whole unclaimed Foreshore of the Harbour should be placed at the Board's disposal for Harbour improvements is not fully understood. If it be meant that it should be at the Board's disposal for sale, or any other such purpose, it cannot be conceded."
- 19. On the 9th of December 1864 Government received, in the Marine Department, the plans and estimates from the Public Works Department (as called for in the orders, vide preceding

construction of two Lighthouses, one on the عثرة

Prongs, to cost Rs. 5 lakhs, and the other at Kennery to cost Rs. 2,69,120. The whole of these papers were, on the 28th

ber 1864, made over to the Harbour Board, with an inquiry Board will be prepared with an annual contribution towards lertaking.

The reply of the Board is given below:-

am directed by the Harbour and Pilotage Board to acknowledge the receipt of the Government Resolution in the Marine Department, 3 of the 28th ultimo, on the proposed new Lighthouses.

"2. The following are the average receipts and disbursements annum of the Funds at the Board's control:—

Port Fund Pilotage		•
Total	2,66,000 1,69,060	1,69,060

Estimated annual surplus .. Rs. 96,940

. 1. No. 943 of

ember 1864.

- "3. Out of this estimated surplus repairs to wharves and all extraordinary expenses in connection with the Harbour have to be met, and these it is apparent will increase instead of decrease annually with the growth of the Port.
- "4. It will therefore be evident to His Excellency in Council how very small the sum is at the Board's disposal for the construction of important and extensive works such as the Lighthouses under consideration.
- "5. It is also to be borne in mind that the Board has been started by Government almost without any surplus balance in its favour; that the surplus of previous years, both from the Port Fund and Pilotage, has been retained by Government; that the latter is also absorbing the profits derivable from the sale and reclamation of the Foreshore of the Harbour; that no Harbour improvements to

speak of have up to the present day been effectivenent, and that those which are essentially required, structures, have yet to be completed.

- "6. The Board is therefore respectfully of opinion that? important and extensive improvements should be largely aid. Government from the surplus of previous years, and the above adverted to now in its hands, and consider that the stress. 7,69,120, now required for the Lighthouses, would form a inconsiderable deduction out of the said profit.
- "7. Nevertheless should His Excellency in Council's tain that the existing reserve of the Board is fairly liable for posted outlay, the Board directs me to state that it was ready to contribute to the extent of Rs 50,000 per annum of the surplus mentioned in paragraph 2 for such time as Gover ment may consider necessary."
- "8. It is indispensable, however, that the work of the Light-houses should be proceeded with, and brought to a conclusion with as little delay as possible, the funds for the purpose being advanced by Government."

And upon this Government ordered that copies of the corresMarine.—G. R. No. 177 of pondence on this subject, with the plans and estimates, should be sent to the Government of India, with a recommendation that the cost of the Lighthouses may be defrayed by Government in the first instance, repayable at the rate of Rs. 50,000 per annum from the Harbour Funds.

21. On the 5th August 1865 a copy of the correspondence since February 1864, as given above Marine.—No. 28 of 5th (beginning with the letter of the Harbour Board No. 106 of 1864, paragraph 15 ante, and ending with letter to the Government of India No 177 of 1865) was sent to the Secretary of State, with the remark that "it will be seen that the final proposals of the Harbour Board agree with the recommendations of Admiral Sulivan, excepting that they maintain their recommendation for a double light at Kennery Island for the sake of more certain distinction from the Colaba Lighthouse and the floating lights."

of the Bombay Presidency for the construction of the Lighthouses on the Prongs and at Kennery; but until the formal sanction of the Government of was received no steps towards the commencement of the could be taken.

3. The reference to the Supreme Government, which was made in the letter No. 177 of 27th March 1865, in the Marine Department (see eapli 20 ante) was replied to by the Government of India as lows:

"I am directed to acknowledge receipt (by transfer from the ome Department) of your letter No. 177, dated 27th March last, submitting plans and estimates for two Lighthouses for the Bombay Harbour, one on the Prongs and the other at Kennery Island, and asking sanction to the cost of the works (Rs. 7,69,120) being defrayed in the first instance from Imperial funds, repayable from the Bombay Harbour Funds at the rate of Rs. 50,000 per annum.

- "2. In reply I am directed to state that the Governor General in Council is clearly of opinion that the arrangement proposed of advancing from the Imperial revenue the fund required for the construction of the Lighthouses in question, to be repaid from the Port fund in fifteen years, would involve the same difficulties financially as constructing the works absolutely out of Imperial revenue. The immediate provision of 7\( \frac{2}{3} \) lakks would be just as inconvenient, and the subsequent repayment of half \( \frac{2}{3} \) lakk a year would be of little use to the finances, while it would hamper and interfere with the action of the new Port trust.
- "3. In sanctioning the Port Fund for Bombay, and requiring that from it should be met the Port charges of all sorts, including lighting, reference was not intended to large projects, such as those now submitted, but only to the ordinary charge for maintaining and repairing Lighthouses and ordinary improvements. There appears therefore to be no bar, as the Government of Bombay seems to understand, to undertaking these projects as Imperial works.

- "4. And moreover it seems to the Government dia that the construction of these Lighthouses is a work the very properly be carried out from the special fund for impressionable, created from the proceeds of the sale of land in island. If therefore on the review of the prospects of this lately ordered it is found that it will meet the charges propose be debited to it, leaving a reasonable surplus, His Excellent Council is of opinion that these Lighthouses may also be including the works debitable to it, and the projects should be mitted accordingly.
- "5. Otherwise it would remain to include the projects a usual away in the Imperial Public Works Budget, if their clarare considered sufficiently urgent, to displace other works, and not of sufficient urgency to be so dealt with the work should a postponed."
- P. W. D.—No. 21-17 of 7th ment for consideration, the following representation was addressed to the Government on the 7th October 1865:—
- "I am directed to acknowledge your letter No. 685c, dated 8th July 1865, to this Government, in the Marine Department, conveying the orders of the Government of India on the subject of undertaking the construction of the Lighthouses on the Prongs and at Kennery from the sale of Land Fund.
- "2. In reply I am directed to observe that the state of this special fund having been minutely reviewed by this Government in its letter No. 100 C.W., dated 28th ultimo, in accordance with the wishes of the Government of India, it is hoped by this Government that no further objection will be taken by the Government of India to the immediate commencement of these most necessary Lighthouses, which may be undertaken as a debit to the sales of Land Fund.
- "3. With reference to the observations of the Government of India, that the Lighthouse should not be charged to the Port Funds, contained in the 3rd paragraph of your letter under acknowledgment,

am de say that this Government will not press the matter debit one work to that source, especially as it is now proposed afray the necessary expenditure from the sales of Land Fund.

4. Should the Government of India sanction the immediate nencement of the Lighthouses, I am desired to observe that and required in this year will be met by a re-appropriation the grant passed for the Moody Bay Reclamation in the ant Budget, and on this point early orders are requested."

5. On a strongly worded representation having been receiv-

No. 2516 of 11th

ed by Government from the Harbour Board as to the delay in beginning the Lighthouses, the Government of India

ras written to again asking for an early disposal of the subject.

26. In the meanwhile a reply, as below, was received from

No. 32, dated 30th November 1865.

the Secretary of State, in the Public Works Department, to the Marine despatch No. 28 (see paragraph 21 ante):—

"Your Excellency's Marine despatch No. 28 of 5th August last, on the subject of the lighting of Bombay Harbour, intimates that on receipt of the sanction of the Government of India to the construction of the proposed Lighthouse you intend to request that the lanterns may be made in England. I observe, however, that the Lighthouses in question include two to be built on Kennery Island, the construction of both of which your Harbour Committee continue to recommend, notwithstanding that both Admiral Sulivan and Mr. Parkes, C.E., when referred to, gave it as their decided opinion that a single Lighthouse would be amply sufficient.

- "2. Your Committee's reason for adhering to their original view is stated to be their desire to ensure 'more certain distinction from the Colaba Lighthouse and the Floating Light,' but I am desirous of being more particularly informed of their reasons for doubting the adequacy of the means for that purpose suggested by Admiral Sulivan."
- 27. A copy of this Despatch was sent to Captain Barker, Master Attendant and Conservator of the Port, who, in reply, addressed Government as follows:—

No. 75, dated 21st February receipt of your letter No. 128 W. of lated Bombay Castle, 13th January, by some mistake the letter was mislaid. The copy of Desalluded to in the 2nd paragraph of your letter has not been receipt of all events, cannot be found; I should feel obliged i could furnish me with another copy.

- "2. I am of opinion that there does not exist any nector a double light on Kennery; in fact, as will be shown here would be likely to prove injurious. A single Lighthor answer every purpose, provided it is made as distinct as reading night as well as by day from the Lighthouse proposed to be erector the end of the S. W. Prong.
- "3. I would propose that an Iron Lighthouse Tower, 80 fee above the highest part, or near the centre, be erected on Kennery Island. This would give an elevation of 180 feet above the level of the sea. That this Tower be four-sided, and that it be painted in alternate red and white bands, each 10 feet wide from base to lantern platform.
- "4. That the light displayed be a bright white light of the first class fixed. It would be seen in ordinary weather. This would not only be a guide on approaching the Port from the south, but from all directions.
- "5. The objections to a double light on Kennery are, that the Island is so small that the light could not be placed sufficiently far apart to be always distinguished as 'double lights' if 1st class lights are used, and any others would be of little or no avail to prevent the frequent shipwrecks and disasters that have of late years occurred, for their rays would mingle and seem as one light until very close to them; this would be likely to lead to disaster. I would further propose that a round Lighthouse Tower be erected of stone on the end of the S. W. Prong, where it dries at ordinary low-water spring-tides; that the lantern platform be 150 feet above low-water mark; that it be painted white from base to summit.
- "6. The light displayed therefrom should be a revolving light of the 1st class. (The present light I believe to be a 2nd class

- ht). Sould be seen from a ship's deck in ordinary weather at 27 miles, and would be seen close in with the shore to the as far as its range extends: the present light is shut in Malabar Point, some 6 or 7 miles from the shore (vide chart impanying the Harbour and Pilotage Board's letter regarding treck of the Jeddo).
- 7. These two Lighthouses would be so perfectly distinct ine from the other, both by night and day, that I cannot is it possible the one could at any time be mistaken for the
- I would again refer to the chart. Every seaman, nay ery landsman, must be aware of the great advantage of 'transit' earings, that is directing the course of a vessel by having two well nown objects in line with each other.
- "9. A ship making the Port from the southward would keep the Lighthouse on Kennery on the starboard or right hand, and long before she approaches that Island the outer Light Vessel and the Prong Lights will be seen. These being kept in 'transit' would lead her well clear of Kennery island and flat.
- "10. A vessel approaching the Port from the northward would keep the Prong Light on the port or left hand, and long before she approaches the Prongs the outer Light and Kennery Light would both be seen. These being kept in 'transit' would lead the vessel over the verge of the foul ground off the Prongs, therefore the seaman would keep the Kennery Light well clear to seaward of the outer Light.
- "11. The outer and inner Light Vessels are admirably placed as to distance from each other (43 miles); the Prongs and Thull Shoal, a direct course between the two Light Vessels, would carry a vessel just clear of the pitch of the S. E. Prong.
- "12. Many improvements have been made since these vessels were built, both as regards vessels and lighting apparatus during the S. W. monsoon. When her services are most required, the outer Light Vessel is almost useless at times from the heavy rolling of the vessel. The Lantern cannot be kept at its proper elevation, and even when lowered the lamps require constant trimming.

- "I trust I may be pardoned for this long". n. 7 importance of the subject is the only excuse I have to oner."
- 28. Captain Barker's foregoing letter was sent to the P. W. D.—No. 6 of 15th tary of State on the 15th March' March 1866. with the remark of this Governmen as Captain Barker now concurred with the views express Admiral Sulivan as to the preference of a single fixed light double one, there seemed to be no reason why these preshould not be at once sanctioned.
- 29. Further representations from the Harbour Boring out the serious losses of the continued want of proper light of the Harbour, led to the following letter to the Government of India on the 14th March 1866:—
- "In continuation of my letter No. 1529 C, W. of 11th December Nos. 60 and 80 of 1866, and 1865, I am directed by the Honourable accompanying chart. the Governor in Council to forward copies of two further letters, as per margin, from the Harbour and Pilotage Board, urging upon the consideration of Government the speedy construction of the Lighthouses at Kennery and on the South-West Prongs.
- "2. His Excellency the Governor in Council, I am to observe, fully concurs with the Harbour Board in their opinion as to the very great necessity of supplying adequate lighting arrangements to this Port, and I am to solicit the sanction of the Government of India to the proposal by the Board to erect at once, at the cost of the Port Fund, an Iron Lighthouse at Kennery, the work to be under the Board's direct supervision.
- "3. The favour of the early reply of the Government of India to this letter is requested."
- 30. The replies of the Government of India to the several No. 334 | C of 29th March representations by Government are to be found below in extenso: they are dated respectively the 29th March and 27th April 1866:—
- "I am directed to acknowledge your letters Nos. 1116c.w. and 1160 c.w., dated respectively the 7th October and 11th December 1865,

gs, Honory Island, and in reply to state, with reference to apparent from the Secretary of State to the Bombay Govern-No. 32 of 30th November last, that the Government of India defer according sanction to the project for the erection of Lighthouses until the decision of the Home Government, is in regard to the character of the Light to be exhibited on ry Island.

1. It is further to be marked that from the latest information not appear to be any immediate prospects of money ble from the special fund."

In reply to your letter No. 2002 c. W., dated the 14th March 1866, urging the speedy construction of the Lighthouses at Kennery and on the S. W. Prongs, Bombay, I am directed to refer you to Public Works' Department letter No. 334° of 29th idem, and to state that until the question of the character of the

idem, and to state that until the question of the character of the Light is decided on by the Home Government the Government of India is unable to accord sanction to the commencement of the work.

- "2. The Rs. 50,000 set apart by the Harbour and Pilotage Board for the erection of the Lighthouses will, I am to remark, be of little use unless the Board can supply the rest of the money needed for this purpose. It would appear that the prosecution of the work, even after receipt of sanction from England, must depend on the state of the special fund as alluded to in the 2nd paragraph of the letter above referred to."
- 31. On receipt of the last letter from the Government of India, a telegram was sent to Earl de Grey, Secretary of State, asking "Is the Light on Kennery to be single or double, flashing or fixed?"

No. 9 of 4th June 1866. received from the Secretary of State, dated 4th June 1866:—

"I have received your Excellency's telegram of 16th ultimo, inquiring whether the Light on Kennery Island in Bombay Harbour is to be single or double, flashing or fixed.

- "2. This is a question for which a brief teres scarcely suffice.
- "3. It has been finally determined that there shall be one Lighthouse, instead of two, on Kennery Island; but suggestion that the light should be fixed appears to have origin with Admiral Sulivan, who, however, recommended it on condition that the Colaba Light should be flashing, and the floating light revolving. An alternative proposal of A Sulivan was that at Colaba there should be a one-minute redioptric light, and on the Kennery Island a ten-second dioptric light. The decision, with respect to Kennewould seem therefore to depend on what may be done at Co. Your despatch No. 6 of 15th March last, referred to in the tegram under reply, signifies your concurrence in Admiral Suliva preference of a single fixed light for Kennery Island, and if it hence to be inferred that the Colaba Light is to be flashing, I also join in your conclusion."

And a copy of this Despatch was sent to the Harbour Board, P. W. D.—No. 1636 of 12th with a request that they "will state July 1866. which of the alternative plans they would recommend for adoption, and further, whether the Board are prepared with funds to undertake and complete the proposed light at Kennery."

No. 346 of 20th July 1866.

33. The Harbour Board replied as follows:—

"With reference to your letter No. 1866, dated the 12th instant, forwarding Despatch No. 9, dated 4th June last, from the Secretary of State for India, on the subject of lighting the Bombay Harbour, and requesting me to state which of the two alternative plans therein alluded to the Board would recommend for adoption, and whether they are prepared with funds to undertake and complete the proposed Light on Kennery, I have the honour, by desire of the Harbour and Pilotage Board, to state, in regard to the 1st inquiry, for the information of His Excellency the Governor in Council, that they concur in the views of Government, viz. that the Kennery should be a bright white light of the

a I d flashing 1st class light, and the outer Floating
Ship to be a red fixed light.

- 2. As regards the 2nd question, the Board direct me to that they are prepared with funds to undertake and combe proposed light on Kennery, provided the entire manage of its design and erection is left to them. If Government action this arrangement at once, the Board will send instruction this arrangement at once, the Board will send instruction the Young, C.B., one of their late colleagues, by next the next South-West monsoon."

34. To the foregoing Government, replied as below:—

"I am directed by the Honourable the Governor in Council to

Kennery—White light—1st Class Fixed. S. W. Prongs— Do.—10-Second—Flashings. Outer Light Ship—Red Light Fixed. acknowledge the receipt of your letter No. 346 of the 20th ultimo, conveying the Board's opinion on the description of lights (as recapitulated in the margin) to be used at Kennery and elsewhere

at the entrance of the harbour, and stating that the Board is prepared to undertake the immediate construction, at its sole cost, of the Lighthouse, &c. at Kennery.

- "2. In reply I am desired to observe that Government concur in the Board's proposal to undertake the building at Kennery, but as regards the kind of lights to be used, I am to point out that the Secretary of State's Despatch No. 9, dated 4th June 1866, has allowed a Fixed light on Kennery only on the condition that the Colaba light should be flashing, and the outer floating light revolving.
- "3. On this point I am desired to inquire of the Board whether they agree to Admiral Sulivan's proposal, or wish for a further reference to England."
- 35. Referring to the Government of India's letter No. 376 | C of 27th April last (see paragraph 30 ante), the Government of Bombay addressed a further letter to the Government of India on the 13th P. W. D.—No. 1640 of 13th July 1866, pointing out that another July 1866. wreck had occurred on the S. W. Prong

in June last, and that in the opinion of the narmishap must be attributed to the imperfect manner in proaches to the Harbour are lighted and marked.

- 36. It should here be noted that in a recent correspon between Government in the Marine Department and the Ha Board (relative to the means at the disposal of the Board to in the event of wrecks) the Board made the following obser on the 19th July 1866:—"The Board distinctly desire to plarecord that they can in no way hold themselves responsible these or any future wrecks that may occur from want of on the Island Kennery.
- "Next in importance to the light on Kennery, the Doard sider a new Lighthouse, with a 1st class light, should be erect near the end of the S. W. Prong at Colaba, as already recommended
- "The erection of these two lights would be a safeguard shipping entering the Harbour, and tend largely to prevent wrecks."
- 37. The Government of India replied on the 27th July 1866 as follows to the last representation No. 652 | C of 27th July 1866. from this Government, No. 1640 (see paragraph 35 ante):—
- "I am directed to acknowledge receipt of your letter No. 588 C. W. dated 13th July 1866, regarding the early commencement of work on the Lighthouse on the S. W. Prong, Bombay Harbour, and in reply to state that the Governor General in Council regrets that in the present state of the finances he is unable to sanction an extra grant for this work, but will be prepared to authorise any re-appropriation of funds from Civil Works which the Government of Bombay may desire to recommend in view to carry it out.
- "2. I am to add that if the Government of Bombay is prepared to arrange for carrying on the work in the manner suggested, a plan and estimate should be at once submitted for sanction, the preparation of materials being meanwhile proceeded with."
- 38. The Harbour Board in the meanwhile, in reference to G. L. No. 1895, of 6th August 1866, replied as below on the 10th idem:—
- "With reference to your letter No. 780 C. W. of 1866, dated 6th instant, I have the honour, by direction of the Harbour and Pilotage

Board,

At although the Board are of opinion that the outer ing Light should show red when the light on Kenney Island libited, so as to make a marked distinction between the outer ing Light and the Colaba or Prongs' light, the Board will to their opinion on this point, and agree with Admiral Sulivan, of than delay the erection of the light on Kennery, so much tance do they attach to its speedy completion.

I am instructed by the Board to ask the sanction of His Exceltor Council to their at once taking this work in hand without

ference to England."

Jose Government thereupon authorised the commencement of the Lighthouse at Kennery in the following letter, dated 16th August 1866, addressed to the Harbour Board:

"I am directed to acknowledge the receipt of your letter No. 394, dated 10th instant, stating that sooner than delay the erection of the Light on Kennery, the Harbour Board will forego their own opinion, and agree to the arrangement of Lights recommended by Admiral Sulivan. In reply I am to inform you that on these conditions the Light on Kennery may at once be proceeded with." and forwarded a copy of the correspondence, ending with the

P. W. D.—Despatch No. 27 of 16th August 1866. foregoing letter to the Harbour Board to the Secretary of State for India, on the same day.

### PAPERS

RELATING TO

## PILOTAGE SYSTEM OF BOMBAY

Bombay:

PRINTED FOR GOVERNMENT
AT THE EDUCATION SOCIETY'S PRESS, BYCULLA.

# PILOTAGE SYSTEM OF BOMBAY.

No. 137 of 1866.

MARINE DEPARTMENT Bombay, 16th April:

From the Secretary to the Harbour and Pilotage Board, Bombay,

To the Secretary to Government.

Sir,—I have the honour to request that you will lay before Fi Excellency the Governor in Council the following Memorandul and Resolution of the Harbour and Pilotage Board, relative to the improvement and reconstruction of the Pilotage system of this port.

2. As it is desirable that no time should be lost in remedying the defects in the existing Pilotage system at present complained of, the Harbour and Pilotage Board would respectfully request an early consideration of the subject on the part of Government.

I have the honour to be, &c.

Henry Morland, Lieut. late I. N.,

Secretary to the Harbour and Pilotage Board.

# MEMORANDUM BY THE HARBOUR AND PILOTAGE BOARD.

1. The Pilotage system of Bombay, as at present constituted, has long been a source of dissatisfaction and complaint on the part of shipmasters and others connected with the shipping interest, owing to the defective manner in which the services charged for under the Act No. XXII. of 1855 are rendered to vessels arriving at and leaving this port, more especially in the Monsoon season.

- 2. Inciency complained of appears to arise not from wak skill or ability on the part of the Pilots, but rather from 1/stem under which the Pilotage duties of the Port have hitherto conducted.
- The Pilots are appointed to do duty after a year or sometimes ter period of probation, and thenceforward rise by seniority different grades into which they are divided, and draw the their grade quite independently of the duty performed, or fficiency in their calling. They are in fact the servants of ir and Pilotage Board on a monthly salary. A certain aber of open boats are provided in which the Pilots put off to ips signalled at the Light House as entering the port, and in nich they return to the shore from outward bound ships which ney have piloted out to sea. All expenses of boats, &c. are paid by the Board, and the Board receives all the fees levied for pilotage under the Act. The superintendence of the Pilots is exercised by the Master Attendant.
- The disadvantages of such a system are manifest. In the first place, as the Pilots receive a monthly salary which is not dependent for amount on the duties performed, there is no incentive to exertion, and the consequence is that the duties are apt to be gone through in a perfunctory manner, and difficulties are regarded as insurmountable which would be comparatively easily overcome were the earnings of the Pilots dependent on their exertions. As an illustration of this the Board would notice the very frequent complaint on the part of shipmasters that they are not boarded by a Pilot till after the greater part of the dangers of entering the Port is passed, and though this is no doubt partly owing to the Pilots having to start from the shore after the ship is signalled, still there can be little doubt that if their pay depended on it they would find a way of boarding vessels earlies. Again, the practice of waiting till a vessel is signalled from the Light House at Colaba before putting off from the Pilot Bunder to board a ship is also conducive to ships not being boarded at the proper time, as, on the one hand, hazy weather may prevent a ves-

sel's being seen from the Light House till very classication on the other hand an adverse wind or tide, or both combined revers the Pilot from boarding a ship until his services are pretty not superfluous. This last remark applies especially to boarding vin the monsoon. Further, the Pilot Boats used, although very able and very serviceable in ordinary weather, are not suited remaining outside the port in the stormy weather of the mon and when they do so, it is often at great risk to those on Passon weather the Board has found it necessal maintain a vessel during the monsoon to assist in case of act to the Pilot Boats, and to lead vessels in when the weather permit of the Pilot Boats putting off.

- 5. The disadvantages of the present system, some of which have been noticed above, seemed so apparent to the Board that they came to the conclusion that something must be done to remed them, and as a first step to this, they procured all the necessary information regarding the system and rules of Pilotage in many of the other great ports, such as Liverpool, Glasgow, Hamburg, Calcutta, &c.
- 6. The result of the Board's investigation went to prove that in no other port but Bombay were the Pilots paid without reference to the duties performed, and also that in all the other ports from which information was furnished, the practise was to board vessels outside the dangers of the port by means of pilotage vessels large enough to keep the sea, cruizing outside the entrance to the port, with a supply of Pilots on board which were drafted off to the vessels making the harbour as required.
- 7. Taking the above two very important differences from the present Bombay system as the groundwork for reform, the Board after very mature consideration came to a decision as to the general outline of a plan for the re-organizing of the present system of Pilotage, taking as their guide the practice followed in the great ports of Europe, with such modifications as were demanded by the difference of climate and other circumstances at this place.
- 8. The Board then delegated to a Sub-Committee of their number the task of drawing up a scheme in detail, and the scheme

of the S ....tee as approved and adopted by the Board is pect. comitted herewith for the approval of His Excellency covernor in Council.

- In the plan is divided into two parts—first, a system of rezions, for the practical working of the Pilotage department; Yeond, the arrangement proposed for the financial working working new organization.
- on The Board in conclusion would beg to state that the toposed has the concurrence of all the members, with the theption of Captain W. C. Barker, the Master Attendant, is the present arrangement with some slight alterations. It is the present arr
- 11. The scheme recommended by the Board is also that approved of in its main features by Captain Young, C.B., their late Vice-President: it will be for Government to decide whether the reform proposed is desirable or not.

Member of the H. & P. Board, and Agent to Lloyds.

## REPORT BY THE SUB-COMMP

Rules for the Working of the Pilotage Department.

- 1. The Bombay Pilots to be a Licensed Service. To paid by shares in proportion to their standing, and the they do.
- 2. Licenses to be granted by the Harbour and Pit Board, which must be renewed on the 1st of every Januar payment of Rs. 30 as a Fee.
- 3. The Pilot Service for the present to consist of Pilots, and three Probationers, which number may be at the discretion of the Harbour and Pilotage Board, as of the Port increases or as circumstances may require.
- 4. The Harbour and Pilotage Board to provide the Schooners of 100 tons each, similar to the Liverpool Pilo Schooners, with such alterations as may be thought necessary to allow increased ventilation for the difference in climate.
- 5. The crew of each Schooner shall consist of a Master, who shall be a Senior Pilot, but not on the running list. He must man his Vessel (with not less than 1 Serang and 14 Lascars), and keep her in good working order. She will have attached to her six Pilots and one Probationer.
- 6. No. 1 Pilot Schooner shall cruise between the Outer Floating Light Ship bearing S. E. 2 miles, and the Island of Kundaree bearing S. E. 5 miles.

The Master must always use his utmost endeavours to intercept, and supply with Pilots all inward bound ships.

He will receive on board his vessel the Pilots from all outward bound ships.

He will remain on his station for seven days, leaving it only when all his Pilots are away, or when he may have received on board three more than his complement. He may then stand in, and No. 2 is at once to take his place.

7. No. 2 shall cruise between the Outer and Inner Light Ships.

hen ply all vessels that have not been served by No. 1. then a nas been seven days at the Outer Station, she (No. 2) so out to relieve her or previously should No. 1 stand in.

- B. No. 3 will be the spare Vessel in Harbour ready to take 2 place whenever she relieves No. 1.
- b. Should any of the Schooners require repair, the other two work the Stations, till such time as the third is ready, taking that the Outer Station is never left without a pilot.

- A good six-oared cutter to be stationed at the Dockyard, old go off to each ship on anchoring to land her Pilot, and hend to take Pilots to outward bound ships.
- 11. The Masters of the Schooners shall keep a journal, which ey shall bring for inspection to the Master Attendant's Office ithin twelve hours of the termination of each cruise.
- 12. The Schooners when they proceed to their stations must have four of their Pilots on board.
- 13. The Pilots not affoat to attend every morning at the Master Attendant's Office, at 10 o'clock, for orders.
- 14. Pilots of inward bounds ships to report to Master Attendant's Office, at once on landing, if it is within office hours, if not, at 10 o'clock the following morning.
- 15. When the Pilots are on board of the Schooners, they are under the authority of the Master, and they must pay strict attention to any lawful order he may give, whether as to taking their turn at working the Schooner, at which they must assist, or as to boarding vessels.
- 16. Pilots shall conform to all the orders of the Master Attendant or whoever may be placed in authority over them.
- 17. Pilots shall not hold any interest on shore in Steam Tugs. They are not allowed to keep a Tavern or Lodging-house, or in any way to retail wines or spirits.
- 18. Pilots are liable to fine, reduction in grade, or suspension of license by Harbour and Pilotage Board, for refusing or neglecting

to take charge of inward bound ships or for any negligent fault or misconduct.

- 19. No Pilot shall claim salvage without the consent Harbour and Pilotage Board.
- 20. The earnings of each Schooner to be divided and on the 1st of every month, or as soon after as she comes in her cruise.
- 21. When the Schooner at the Outer Station fails to san inward bound ship with a Pilot, and such inward boungets supplied from No. 2 Schooner, then the Pilots shall ceive (for division into shares) one-third of the sum have been entitled to had such vessel been piloted in from sea.

When No. 2 Schooner fails to supply an inward bound shi with a Pilot, none of the pilotage money shall be given to the Pilots.

Should either Schooner be within moderate distance of the inward bound ship and offer a Pilot, then they shall receive the same share as they would have received had they put a Pilot on board.

## Examination of Pilots.

1. The Harbour and Pilotage Board shall appoint as Examiners of Pilots—

The Master Attendant, One Master of Schooner, One Running Pilot, Lloyd's Marine Surveyor.

2. Applicants for admission to the Pilot Service must be 21 years of age, and of good health. They must hold a Board of Trade Certificate of not a lower grade than "only Mate," and they must produce certificates of strict sobriety and good conduct.

They will then be eligible for an appointment as a Probationer.

3. The Master Attendant to have the appointment of Probationers.

- welve months as a Probationer they may go before Example a Committee, and if they pass, the Board will grant a License as a 3rd Class Pilot on the first vacancy.
  - 3. Their subsequent steps to 2nd and 1st Class Pilot always given by seniority, according to vacancies.

### Shore Establishment.

).

- v. The First Assistant Master Attendant will appoint Pilots hation to outward bound ships, and he will be the Master nt's principal assistant in every thing relating to the Pilot afce duties on shore, including the care and inspection of later hat hat he had been belonged to the Harbour and Pilotage Board.
- The Second Assistant Master Attendant shall be called ne Harbour Master. His duties shall be to direct where the ships are to be berthed. He will have the charge of all Buoys and Beacons in the Harbour. In the event of fire or other accident he will attend with all the Pilots not on duty in the Schooners to render what assistance may be required, and he will be the Master Attendant's principal assistant in every thing connected with the Harbour. He will inspect quarterly and report on the state of the Pilot Schooners, also the Floating Light Ships, and under the Master Attendant shall have charge of the general conservancy of the Harbour.

# Proposed arrangement for the financial working of the Pilotage Department.

The actual receipts on account of the Pilotage Department for the last five years appear to have been—

For year 1860-61 Rs. 1,41,990 12 0 1861-62 ,, 1,26,784 6 0 1862-63 ,, 1,25,396 8 0 1863-64 ,, 1,39,056 12 0 1864-65 ,, 1,55,006 14 0

The close of the American war may have an effect in reducing for a time the amount of receipts, but the extension of the railways,

and the natural increase of the trade of the port to kee the income fully up to that of last year. In estimating proble receipts on account of the Pilotage Department for the puriof finding a basis for the financial part of the new scheme, I if we take Rs. 1,40,000 as the income, we shall not be placing amount too high. The present expenses of the department roughly may be called Rs. 1,00,000 per annum. Taking the mated income as above, this shows a clear surplus of Rs. 4 per annum.

In November 1864 there was transferred to the Har' Pilotage Board accumulated balances for the Pilotage furing to Rs. 98,000, to which falls to be added this past year's say Rs. 50,000, making a sum in hand on account of the department of Rs. 1,48,000.

It is proposed to build in England three Pilot Schooners, the cost of which laid down in Bombay may be taken at Rs. 45,000 each, complete with boats, &c., making a total Rs. 1,35,000; this sum will be provided out of the above accumulated surplus of Rs. 1,48,000.

These Schooners will be handed over complete to the Companies of Pilots, and thereafter will be maintained and kept in repair by them.

In order to repay the Board the money laid out on those vessels, and to secure to it a fair share of the income arising from the Pilot Service, it is proposed that the receipts on account of Pilotage should be divided into shares, and that the Schooners, or the Board for the Schooners, should have a certain number of these shares credited to them.

If the Pilotage receipts were divided into 64 shares, the income would amount to nearly Rs. 2,200 per share. Of this, fifteen shares or Rs.33,000 should go to the Schooners, and five shares or Rs. 11,000 to the Pension Fund to pay pensions and allowances now running, or to be incurred; the remaining 44 shares, or Rs. 96,800, will go to the Pilots for salary and expenses of maintaining the Schooners. Say the expenses for each Schooner are Rs. 1,200 per month for

crew,pra weores, repairs, &c. exclusive of Pilots' remuneration, which is a full estimate, the expenses of the three Schooners d be Rs. 43,200 per annum; there would thus be left for on among the Pilots a sum of Rs. 53,600 per annum.

The present number of Pilots is 16, and this number, might be

The present number of Pilots is 16, and this number might be ned, including the three Senior Pilots, who are to command the poners.

V-Say 3 Senior Pilots, Masters of Schooners and General Superintendents of their Companies.

4 First Class Pilots.

भौट6 Second Class Pilots.

A If Third Class Pilots.

g — 16

Afthree Probationers would also be employed in addition to the above.

The portion of the receipts applicable to Pilots' salaries is Pupees 53,600; this would admit of the following salaries:—

3 Senior Pilots, Rs. 400 per mensem Rs. 14,400 per annum.

4 1st Class ,, 300 ,, 14,400 ,, 6 2nd ,, ,, 250 ,, 18,000 ,, 3 3rd ,, ,, 200 ,, 7,200 ,, 7,200 ,, 76,000

Or a few hundred rupces in excess of the amount stated.

The allowance to Probationary Pilots will fall to be paid by the Harbour and Pilotage Board.

The above allowance for Pilots includes every thing, and no extra payment, such as that for house-rent, would be allowed under the new arrangement.

With regard to pensions, the running of time for pensions would stop when the new system commenced, and when a Pilot who has now served so many years towards a pension retires hereafter from the service, he will be paid a pension by the Board in proportion to the service he can show under the present régime;

or, if he prefers it, he may cancel his claim for p
as compensation a present money payment from the
money payment, if accepted in a number of cases, might be bo
ed in the meantime from the Port Fund and repaid gradually.
sum of Rs. 11,000 per annum which the five shares of the rereserved for pensions would yield would thus gradually be re'
of claims, and come to form an ordinary receipt.

The expense of a Harbour Master will fall on the Port and from the money received from the Pilotage proceeds c the Port Fund, if that does not prove sufficient, will he paid salary of the three Probationer Pilots, cost of Cu harbour, and cost of establishment for Pilotage purposes in Master Attendant's Office.

A system of fines for any dereliction of duty will have to instituted, and the Pilots must be kept up to their work by deductions being made from their earnings when their duty is not properly performed. Those fines will go to form a subscription by the Board to a Sick and Pension Fund, to which the different Pilot Companies ought to subscribe under the new system. As no pensions for service under the new order of things will be paid by the Board, it is desirable that a Sick and Pension Fund should be created in order to prevent worn-out and inefficient men from remaining on the active roll.

The fees received for the license of the Pilots, annually, might also be devoted to the Sick and Pension Fund.

In spite of any regulation to the contrary, it is quite certain that in Bombay, as in any other port, the Pilots will get gratuities from Captains of vessels, but it is the duty of the Board to prevent any Captain of a ship who does not choose to pay a gratuity from suffering on that account, and to do this it is most desirable that the berthing officer should be quite distinct from the Pilots, and free from their influence.

#### No. 352 of 1865.

Office of the Master Attendant and Conservator of the Port,

Bombay, 1st December 1865.

ORANDUM.

Vorwarded for the consideration of the Harbour and Pilotage Vol., with the compliments of the Master Attendant and Con-

W. C. BARKER, Retired Captain, I. N.,
Master Attendant and Conservator of the Port.

## Proposed Establishment.

Six Pilot Boats.

One Conservator's Boat.

One Cutter of six oars.

One Gig of six oars.

Two Jolly Boats, of four oars each.

One of the latter, for the Pilot Bunder, Colaba, and one for the Dockyard, to convey to and from their respective. Boats the Pilots and Boats crews; frequently the Pilot Boats cannot approach the Landing places.

No crew will be required for either of these Boats.

Three spare Pilot Boats will be kept ready in every respect for launching at short notice in case of accident or disaster, two at Colaba and one in the Dockyard.

One Syrang to superintend all and see that the Boats are kept in good order, and to preserve order and		
cleanliness in the Banks Hall R	ls.	35
One Signal Tindal to look out during the day and report all signals made, and every occurrence that		4¢
takes place in the Harbour	,	25
2 Notice Cooks on Daniel Co. 1	,	36
Carried forwardF	{s.	96

Brought over

Total ... Rs. 1,90

	Lascars, at Rs. 15 each	,
1	Gig Tindal	
5	Lascars, at Rs. 15 each	
2	Sweepers, at Rs. 3 each	
	<del></del>	

With provisions according to scale granted to Lascars of Bombay Marine.

# For South-West Monsoon only,

viz. from 1st June to 30th September.

One Brigantine of 180 Tons.—A fore and aft Schooner will not answer; it is indispensably necessary for this duty that the vessel should have square sails on the foremast to run in before the heavy breaking sea that generally prevails at the entrance of the Harbour at this season, particularly when blowing hard and tide running ebb; instances have occurred of the old Pilot Brigs of 108 tons and upwards having been "pooped" and on several occasions nearly swamped.

The Vessel should be supplied with one good Life-Boat and one 6-oared self-righting Boat. The davits to be fitted to swing in board.

I would propose that this vessel should be manned as follows:-

Probationary or Third Class Pilots to receive one and a half Rupees each per diem in addition to	Rs.	90
pay and house rent	**	90
Provisions	,,	40
ysyrang	,,	36
Indals, each Rs. 25	,,	50
s west Class Lascars, at Rs. 17 each	,,	204
મુંબે Class do. ,, ,, 15 ,,	٠,	180
ife Class do. ", " 13 "	,,	156
g. Topass	,,	10
t Bundary or Cook for Lascars	,,	12
of Officer's Servant	17	15
1 Officer's Cook	,,	15
Total	Rs.	898

To be allowed provisions on same scale as issued to crews of vessels of Bombay Marine.

This may appear a large crew, but it must be borne in mindthat frequently both Boats may be away at the same time with a smaller crew, in such cases sufficient men would not be left on board to work the vessel.

Towards the close of the monsoon, that is about the 20th September, the vessel to be recalled, dismantled, and laid up at Mazagon or other convenient place. The Master Attendant may select her spars, sails, stores, running rigging, &c. &c., all to be carefully tallied or marked and secured as may be found most convenient either on board or in godowns on shore. The crew to be discharged on 30th September, and a Harbour crew appointed as follows:—

1	Tindal	Rs.	25
6	Lascars, at Rs. 15 each	,,	90
		•	
	Total	. Rs.	115

To receive provisions in addition.

These are necessary to keep the vessel clean and in order from time to time to dry the sails, &c. &c.

# Office Establishment.

1 Master Attendant and Conservator of the Port, Resof Shipping, &c.

First Assistant or Deputy Master Attendant and Conserv of the Port and Deputy Registrar of Shipping.—The first A duties will be (under the Master Attendant and Conserv Port) principally confined to the office. To examine, compare all Indents, Survey Reports, Pay Abstracts, &c. &c. attend to entry of ships, examine ship Registers, endorse on batthereof (when necessary) change of Masters, examine the calculation of all ships measured, whether square rigged or native craft, for the granting of Registers and Cowls. To see that the several records of the office and all documents connected therewith are duly kept up, and as all applications for Pilots, whether to take vessels to sea, docking and undocking, transporting, &c., are sent to the Office, to appoint Pilots for the aforesaid duties.

Second Assistant Master Attendant and Conservator of the Port.—To be also Surveyor of the Port and Harbour Master. officer's duties will be principally affoat, to see the berthing of vessels, that the vessel keep clear house, that none of the Regulations of the Port are infringed, such as boiling pitch on beard or in too close proximity to their vessels, that Boats be not allowed to hang on stern to the detriment of the free navigation of the Port, and to keep free and clear passages through the shipping for all vessels entering or quitting the Port, &c. To see to the examination and that they are kept in serviceable condition all moorings and danger Buoys throughout the Harbour. To examine and inspect at least once in every three months the Outer and Inner Light Vessels and Dolphin Light, as to the state and condition of the Lanterns, Lamps, &c. &c., and with regard to the two former to heave up and examine their moor-When these inspections have been made, the same to be duly entered in a Book kept for that purpose, with full particulars of such

pectical Multiple bubmitted to the Master Attendant. To superintend coking, undocking and transporting of Vessels, and as Surveyor Port, the measuring of all Vessels requiring new Register, er square rigged or native craft. To be prompt in rendering unce in case of accidents or disaster, such as fire, ships ground-you fouling each other, &c. &c.

V. Sy:hird Assistant Master Attendant and Conservator of the Larin Deputy Harbour Master.—To assist the Harbour Master in Syrenamed multifarous duties.

rvices of both Second and Third Assistants will, how-

The following is the Establishment and scale of pay of the lerks of the Master Attendant and Conservator of the Port's Department, as per Harbour and Pilotage Board's Resolution No. 104, dated 12th April 1865:—

* I would recommend	Head Clerk*Rs.	115 per	month.
to the favourable consi-	2nd do,	65	,,
deration of the Board that the Head Clerk's	3rd do,	<b>5</b> 0	**
pay be increased to R.	4th do,	40	,,
150 per mensem.	5th do,	40	,,
	6th do,	35	٠,,
	Shroff ,,	40	,,
Harbour and Pilotage Board's Resolution No.	1 Naique,	12	,,
159, dated 30th May 1865.	Peon,	10	,,
Vide Harbour and Pi-	l Sweeper,	2	,,
tion No. 18, dated 16th January 1865.	Waterman	1	,,
	Total Rs.	410	

Great difficulty is experienced at present for want of a "Compiling Clerk" when necessary to refer for any former correspondence, with the present Establishment. No particular Clerk can be spared for the duty of preparing the Indices of the several Books of Correspondence, Files, &c. &c. I would therefore recommend in addi-

tion to the above a Compiling Clerk on a samensem.

#### Pilots.

The maximum number of Pilots at present allowed entertained is sixteen; four more I think necessary so as to a total of 20, not including the officer in charge of the Light Vessel or Mate.

I would again urge on the Board the reconsideration pay of the Pilots, which I consider is very inadequate for thiv aluable and useful class of Public Servants.

Their pay at present is scarcely sufficient to suppo. it is utterly impossible to make any provision for the future.

Candidates for the situations of Pilot should produce sate affactory testimonials as to character and ability, as to their sobried and good conduct, and be good practical scamen.

Prior to being entertained they should undergo examination by the Marine Surgeon, as to their fitness physically.

The Master Attendant should have the appointment of all Pilots, who should undergo a probation of one year, six months with Outward Pilots, docking, transporting, &c., and six months with Inward Pilots.

At the end of this period to be examined as to their qualification for the situation of Pilot by a Committee composed as follows:—

> 1st Assistant (or Deputy) Master Attendant, 2nd or 3rd Assistant, One 1st Class Pilot.

Their proceedings and report to be submitted to the Master Attendant, who being satisfied therewith, will furnish him with a License as 3rd Class Pilot, subject to approval and sanction of Harbour and Pilotage Board.

In the event of not being found competent for the situation of 3rd Class Pilot at the expiration of one year, to be given one month's notice and then discharged.

The Declassed as follows:One Senior Pilot.

- (6) Six First Class Pilots.
- (6) Six Second do.
- (7) Seven Third do.

# 20 Total.

\*\*.

Sylo not consider that the present system of working the line improved upon, namely, that of having a certain set of off for taking ships to sea, docking, transporting, &c., and in number stationed at Colaba for the purpose of follows to in-bound vessels.

The Colaba Pilots are relieved yearly on the 1st January, two 1 1th's notice being given to make the necessary arrangements 1. In regard to house accommodation.

The system of substituting Schooners for Pilot Boats has been tried and failed, one Schooner or Brigantine rather (for reasons before shown) I think necessary to cruize off the Port during the South-West Monsoon, not only to guide vessels in, but to be ready in case of disaster, such as loss of masts or swamping of the Pilot Boats.

It will be necessary to retain this vessel for duty during the South-West Monseon, even after the Light Houses on the Prong and Kenery are established for reasons stated above.

## Anchor Hoy.

The want of such a vessel is often productive of inconvenience and frequently of serious loss. It is true there, is some such description of vessel attached to the Marine Department, but she is old, unwieldy, and fitted up very roughly; such as she is, however, she is not always obtainable; and when so, unless the charges have been reduced very lately, the hire for her per diem I consider very high.

The Establishment of the "Palinurus" is one Diver in charge Rs. 30 per mensem (at present there is none), he having been drowned some months since

while diving for "Shannon's" moorings); two shannon Rs. 11 each per mensem and 3 rations.

Say one Syrang	30	Rupees.
Two Lascars, Rs. 11 each	22	,,
Provisions for 3 Natives, say Rs. 5 each		
per mensem	15	,,
Total	Rs.	67

Wear and tear of hull and rigging nil—the vessel is and fro by steamer or Pilot boats.

In the centre four common copper oil lamps without reflectors.

On the occasions of either of the Light Vessels requiring repairs the "Palinurus" has hitherto taken the place of the "Shannon" or Inner Light, a portion of the crew of the Light Vessel under repairs being attached to her to hoist up the lantern and lamps, &c, the remainder attending to their vessel in Dock, cleaning out the hold, refitting, rigging, &c.

When the Light Vessels last received a thorough repair in Her Majesty's Dockyard, the "Palinurus" took up the station of the Inner Light Vessel from 30th January to 26th May 1860, and a charge was made by the Dock Master for the full period, viz., 118 days at Rs. 30 per diem, making a total of Rs. 3,540, a most enormous charge!! I remonstrated, but in vain. If the vessel was sold by public auction, I doubt very much whether she would realise even a moiety of the above. I would observe further that this charge of Rs. 30 per diem is still made by the Dock Master every time the "Palinurus" is engaged, and she is the only vessel we can engage for lifting heavy moorings, raising sunken Boats or Pattamars, &c.

This of itself shows the advisability, nay, the urgent necessity, of having a suitable Anchor Hoy attached to the Department. It

・中心は変数。

peford with I propose fitting the Lantern to the Powder Hoy, arge for which vessel will be less than that of the Anchor one-half; but even this I consider a very heavy charge, for ances are all the Vessels would otherwise be laying idle in Domain. While on this subject I may allude to the case of the of Manchester," which vessel entering the Harbour on the gof the 27th November grounded on the South-West Prong; ately it was near low water and there was but little wind or the Ar. Corke at once proceeded out, and by laying out the prand backing the sails, as the land wind set in, the tide rose was hauled off, I trust, not much injured.

But supposing there had been but a moderate breeze and sea, it kedge anchor would not have been sufficient for the purpose; landy Anchor Hoy, with powerful windlass and capstan, (and one capable of being taken quickly to the spot,) would on a future case prove invaluable.

Instances are by no means rare of vessels losing overboard heavy cases. The Anchor Hoy would in such circumstances proceed instantly to the spot, and the article would be recovered.

Of course a charge would be levied for this service, which would tend in a great measure, if not altogether, to defray the expenses of maintaining such a vessel.

Again, frequent applications are made from Masters of merchant vessels for a vessel to convey heavy weights, such as steam machinery, &c. &c., to or from the shore; the vessel might on such occasions be lent, and a moderate charge levied for her services.

I would suggest a vessel of about 80 tons burthen, copper fastened and coppered, of strong build, no projections except the cat heads (they cannot be dispensed with) which should be very strong with three sheaves of large diameter.

No bowsprit or main boom, two masts fore and aft, main-sail and fore-sail and fore-stay sail, so that unlike the present Anchor Hoy she could be moved about from place to place as required without having to resort to the aid of steam.

I have called upon the Master Builder to furn. with a plan and estimate of the probable cost of building success. She should be about 60 or 65 feet long, her beam one-third length, and not to draw more than (6) six feet water with stores, &c., on board. When estimate is received the same a be laid before the Board. She would require a lower deck and aft (with hatches at convenient places) the forepart of we should be for the accommodation of the crew, the remainder stowing away hawsers, tackles, &c.

The vessel should have a powerful windlass in the and a strong built patent capstan in afterpart; she could made available for undocking ships by being secured to the steafast moorings; a moderate charge being levied from each vesses making use of the "Hoy."

One square sterned 4-quired Jolly Boat would be required for running out lines, &c.

Crew to consist of-

One Syrang and Diver	Rs.	35
Four Lascars, each Rs. 15	,,	60
With provisions 3 as issued to Dockyard		
Lascars, say 5 Rs. × 5	,,	25
Total	D <sub>a</sub>	120
10::	. Its.	120
		-

A better description of Lantern than that used by "Palinurus" when at the Rock Station could be made in the Factory to be fitted to the main mast, and only attached thereto when her services are required as a Light Vessel. This can easily be arranged by having the frame work of the Lantern in two segments, 3 Lamps with reflectors on each side.

W. C. BARKER, Retired Captain, I. N.,
Master Attendant and Conservator of the Port.

Commissioner of Customs, No. 187, duted 10th Sept. 1860.

Paragraphs 14 to 18.—The Inner Light Vessel "Shannon" Outer Light Vessel "Colaba" requiring extensive repairs, the hor Hoy was engaged for the duties of the Inner Light Vessel 1 both vessels were repaired, which repairs were executed in 'Dockyard, and extended over the period named in the Bill, viz. "days.

The puld particularly draw your attention to the fact that durfunce period that the Anchor Hoy "Palinurus" was at the
cock Station, the Syrang was never on board of her, except during
the time he was engaged as Diver, duly charged for in Bill No. 21
that the enormous rate of Rs. 15 per diem, he the Diver at the same
time receiving a salary of Rs. 30 per mensem from Government.
I would observe that although the Diver is borne on the books as
Syrang of the Anchor Hoy, it is merely for the purpose of attaching him to some definite appointment that the salary might be duly
charged for.

It will appear therefore that the actual expense incurred by the Dock Master's Department for the Auchor Hoy "Palinurus," merely for the pay of two Lascars, the charge would be Rs. 22 per mensem, which for 118 days would amount to Rs. 85-13-10. The charge in the Bill is Rs. 3,540, rather a large margin for wear and tear, if such is meant.

I would again repeat that it is much to be regretted that the Warp Boats and Anchor Hoy should be retained in Dock Master's. Establishment.

W. C. BARKER, Retired Captain, J. N.,
Master Attendant and Conservator of the Port.

Bombay Harbour, Pilotage.

No. 285.

MARINE DEPARTMENT.

Bombay Castle, 27th April 18

Letter from the Secretary, Harbour and Pilotage Boar 137, dated 16th April 1866.

Submits a Memorandum and Resolution by the Harbour and Pilotage Board, respecting the improvement and reconstruction of the Pilotage system of the Bombay Harbour, and requests early consideration of the subject. Submits also a scheme by Captain Barker, who dissents from the proposals of the Board.

RESOLUTION.—A copy should be sent to the Chamber of Commerce, with a request that they will favour Government with an early expression of the opinion of the Chamber on the proposed alterations in the Pilotage system.

Copy should also be sent to Captain Giles, for the favour of his opinion and report on the proposals.

J. MACDONALD, Major,
Acting Secretary to Government.

To the HARBOUR AND PILOTAGE BOARD.

#### No. 281 of 1866.

Harbour and Pilotage Board, Bombay, 22nd June 1866.

"( To the Secretary to Government,

\ch

MARINE DEPARTMENT.

In Sir,—Adverting to my letter, No. 137, of the 16th of April 16, and Government Resolution No. 205, dated 27th April 1866, and, on, I am directed by the Harbour and Pilotage Board to the consideration of His Excellency in Council, the Laumber of vessels boarded by Pilots as they entered the Harbour, the council the Harbour, the Harbour of the week ending the 16th of June 1866, and in doing so to a state that the Board do not attribute blame to any person connected with the Department, but that they consider, with the present Pilotage system, it is impossible to expect better results, especially at this season of the year when the setting in of the monsoon renders it impossible for the present Pilot Boats to work sufficiently to windward to enable the Pilots to board vessels outside the dangers of the Port.

From the statement I have the honour to submit, it will be seen that from the 8th to the 16th instant 33 vessels entered the Port: of these only 6 were boarded by Pilots outside the dangers; and 2 (1 at anchor) were boarded close to the Outer Light Ship; 8 were not boarded until they were inside the Port, between the Light Ships; and 17 were not boarded until off or to the Northward of the Inner Light Vessel, and most of them at anchor, having escaped the chief dangers of the Port unpiloted.

The Board are of opinion that by the adoption of their scheme, submitted with my letter above referred to, the delay in supplying Pilots will be obviated, and they therefore solicit the early sanction of His Excellency in Council to their bringing the same into action.

I have, &c.,

H. Morland, Lieut., late I. N., Secretary.

forted 26th June 1866.

Forwards a Statement of Vessels boarded by Pilots, &c., for e week ending 23rd instant, as another instance of the inefficiency the present Pilot Service, and requests to be favoured with the decision Government may have passed on the proposition to reorganize that Service.

Resolution.—The Harbour and Pilotage Board may be informed that the decision of Government on the proposal to re-organize the Pilot Service has not yet been recorded, a reply from the Chamber of Commerce, to whom the proposals were submitted for re-port, having been only this day received.

J. MACDONALD, Major, Acting Secretary to Government.

TO THE PRESIDENT HARBOUR AND PILOTAGE BOARD.

No. 310 of 1866.

From Commander E. Giles, I. N.,

Master Attendant, Kurrachee,

To Major MACDONALD,

Acting Secretary to Government, Bombav.

Dated 22nd May

Letter from Secretary to the Harbour and Pilotage Board, to the Secretary to Government, No. 137, of April 16th, with a Report and Memorandum by the Harbour and Pilotage Board of Bombay.

Sir,—I have the honour to f Report called for in your letter 1 April 27th, Marine Department, covering to papers as per margin.

•I have the honour to be, &c.

E. Gilles, Continander I. N.,

Master Attendant, Kurrachee.

#### REPORT.

I agree in opinion with the Harbour and Pilotage Board, that the system under which the Bombay Pilot Establishment is now worked makes no call on the individual exertion of the Pilots, and that a careless and sloven way of performing their duty is in some cases the result.

- 2. I agree too in opinion that, were the Pilots paid only for the work performed by each, they would, as a rule, find means to board ships arriving off the Port earlier than is now the case, and that the complaints now so common against the Department would in a great measure cease.
- 3. The great difficulty that presents itself in dealing with the question appears to be the provision that has to be made for the bad weather of the S. W. monsoon; the Board remark on this, that at times the present Pilot Boats (which are suitable and trustworthy

ordinate eather) cannot safely venture out, and that it is essary in consequence to attach a sea-going vessel to the artment for duty outside with the Pilots at this season.

- 4. Even with this assistance, the work, it is stated, has been dly performed, that it is now proposed to introduce an entire se of system.
- it, are clearly shown in the Reports under notice. The rules for a closer supervision of the Pilots, with penalties for negative, &c., and the scheme, as it now stands, would, doubted for better than the present plan.
- 6. The Board have not, however, adopted the free Pilotage Eystem to any extent, and there is consequently no latitude given for individual exertion; true, the Pilots are divided into Companies; but these Companies have no inducement to work the one against the other, as under the rules proposed, all their gains will be thrown together for equal division among the whole establishment.
  - 7. Believing as I do that competition is the chief element necessary to ensure good work, I would strongly advocate its introduction as far as possible.
  - 8. The division of the Pilots into Companies (as proposed) is, I should say, the best arrangement possible under the circumstances, provided each Company work entirely on its own account, dividing among themselves in proportion to their grade, any amount they may actually make, on the number of salary shares allotted them by the Board.
  - 9. There is one other very important point on which I differ from the Board.
  - 10. It is proposed to substitute three Schooners of 100 tons each, of the Liverpool Pilot Class, for the present Pilot Boats.
  - 11. These Vessels to be purchased from surplus funds, now at the Board's disposal, their estimated cost being Rs. 45,000 each, or Rs. 1,35,000 in all.

- 12. As regrds this proposal I would venture gest that before expending so large a sum on an entirely new craw of veit may may be well to consider if the inefficiency of the Pilot Bhas been so decidedly established as to make so sweeping a chall at once necessary.
- 13. The Board have placed on record that these Boat suitable for the work in ordinary weather (that is for nearly months in the year), and that more work would be done di-Pilot's pay depend on individual exertion. May it not the more the fault of the men than of the Boats that things badly?
- 14. For myself I must say that I have always heard the Boats highly spoken of, and I believe them to be safe and weight adapted for boarding ships even in monsoon weather out as far the Outer Light Ship; further I believe that skilful Pilots, working on their own account, would seldom hesitate to proceed beyond this in them on the chance of picking up a ship.
- 15. Before making the change, moreover, it would be advisable to determine by actual experiment, if the schooner it is proposed to order are suitable for work in this country. I doubt not their being good sea boats, but I much doubt if a serviceable vessel of 100 tons can be sufficiently ventilated to permit a considerable body of men to live on board in all weathers with any degree of comfort, and further, whether native seamen will be able to launch and manage the small Boats these vessels must use for boarding ships in heavy monsoon weather, with the same skill and consequent safety that European seamen could do.
- 16. Captain Barker (the late Master Attendant) has placed on record (vide his Report to the Board, that the plan of substituting Schooners for the present Pilot Boats has already been tried, and failed: now I fully admit this trial was hardly a fair one, as the vessels tried were heavily built of teak, were very low in the water, and much over-masted, still I think that a trial of the kind having been made and having failed, is an additional reason to proceed with caution.

- order, when, if found to answer, a second or third might be ured, should the Board still think it necessary.
- 18. Differing from the Board's proposals in the above important ts, I think it right to state generally what changes would (it are to me) be necessary to meet the modifications suggested.
  - 1st. The Companies of Pilots to work independently of each other, and to divide among themselves (in the proportion to each grade \* fixed by the Board) the whole amount they may make on the number of salary shares allotted.
- The Row Boats, though generally required for Harbour use, might occasionally in light winds be found most useful outside.
- At Kurrachee, nearly the whole Pilotage work is done in boats of this class; they are fitted as Life Boats for bad weather.
- 2nd. Two of the present Pilot Boats with a 6 to 8-oared Boat to be supplied to each Company of Pilots; these Boats to be maintained by them complete for work.
- 3rd. The Pilot Bunder at Colaba, with a shed for each Company, to be made over, all repairs to Boats to be done at a moderate percentage in the Dockyard, and all stores required for the Boats to be supplied by Government on the same terms.
- 4th. The Boats of each Company to be painted, so as to be easily distinguished from those of the other Companies, and they should fly a distinguishing flag; each Pilot should be provided with a flag of his own Company's color; this shown from a ship, either in Port or outside, would call one of his own Boats alongside.
- 5th. A Pilot having secured an inward-bound ship, he or one of his own Company to have the privilege of taking her to sea, or of moving her in harbour, should it be required.
- 6th. One-third of the Pilots of each Company to be available for duty in Harbour.
- 7th. The Companies of Pilots shall arrange among themselves rules for working their Boats and cruising outside.

- 8th. All their arrangements must be report and be approved by, the Master Attendant; the Senior Pilot channel of communication with that Officer.
- 9th. Probationary Pilots (paid by the Board) to work c occasions with the Senior Pilot of each Company, and take orders from him.
- 10th. The General Rules for Pension, Discipline, &c., a down by the Board will still be equally applicable:—

The work to be done by the vessel will be much as at present, but it is hoped that she will (being of the Liverpool Pilot Class) be better adopted for cruising than the Vessels heretofore supplied, and that as the Pilots in charge of her will have a direct interest in the actual amount of money taken more exertion to intercept Vessels may be made to them.

Moonsoon season (September) a suitable vesself, fitted out and maintained by the Board, to be placed on the station at the end of the season, she should be dismantled and be laid up.

- 12th. The Vessel to be officered by three Pilots: one of each grade, 1st, 2nd, and 3rd; one from each Company (to be changed each season). These Pilots will receive their proportion of the Pilotage money made by their Companies an additional gratuity might be added by the Board at the end of the cruise if the work has been satisfactorily done).
- 13th. The Senior of the above Pilots, who must be in charge of the Pilot Vessel, should keep a plain mess, (without liquor,) to which each Pilot received on board should pay such daily sum as may be fixed.
- 14th. The vessels to be open to Pilots from any of the Companies, they being placed on board by their own boats, and she will receive the Pilots from outward-bound ships.
- 15th. The Pilots must be supplied (from the General Pilot Vessel) to ships arriving, strictly in turn of Companies, No. 1 Company supplying the first Pilot, No. 2 the next, and so on.

Boats of the different Companies to have full liberty cruisd mips without reference to the general Pilot Vessel.

E. GILES, Commander I. N.,

Master Attendant, Kurrachee.

<sup>t</sup>Kurrachee, 22nd May 1866.

Bombay Chamber of Commence, Bombay, 27th June 1866.

. . .

No. 158 of 1866.

To the Secretary to Government,

Marine Department, Bombay.

Sir,—I am directed by the Committee of Management of the Chamber of Commerce to acknowedge the receipt of your letter, No. 285, dated 27th April, handing copy of a Memorandum from the Harbour and Pilotage Board, making proposals for a reconstruction of the Pilotage system of Bombay Harbour, on which Government requests the opinion of the Chamber; and with reference to your subsequent letters of 6th and 26th instant I am further to express regret for the delay that has unavoidably been incurred before addressing you on the subject, owing to the time taken up in circulating the papers amongst the members.

In reply I am now directed to state for the information of Government that the proposed scheme will, in the opinion of the Committee, be a very great improvement on the present system, the inefficiency of which is complained of on all hands.

It is, however, the opinion of the Chamber that the share of the earnings which the Board propose to retain to themselves is excessive.

The Committee can see no reason why on such a system as that proposed, the Board should seek to retain any share of the profits

of the service beyond what may be necessary to sinking fund for replacing schooners lost or worn out, and the consideration per cent. would, at the outside, be found sufficient for purpose.

The Committee are further of opinion that the scale of r neration proposed for the Pilots is not sufficient to secure men, thoroughly qualified for their work, taking into accoun deductions their income will be liable to, the deductions a suggested in reference to the amount proposed to be retained 'Board should be applied to the augmentation of the shares among the Pilots, and this might enable the Board to rai of pay for senior Pilots to Rs. 450 or Rs. 500 per menses, others in proportion.

It should also be provided that the five sixty-fourth shares set apart for the payment of the pensions of the old Pilots be applied, after that purpose is served, to the improvement of the Pilot Service, in such manner as may from experience be found expedient.

The Committee also consider that the rate of Rs. 45,000 for each schooner is much too high, but as details are not entered into regarding this part of the scheme, they desire merely to indicate an impression rather than to express an opinion, in order that the matter may be carefully examined by Government.

With the exceptions as to some important points of detail indicated above, the proposed scheme has the approval of the Chamber, and the Committee trust Government may be able to give it consideration, with a view to its being carried out as early as may be practicable.

I have the honour to be, &c.,

JAMES TAYLOR,

Secretary.

Bombay Harbour, Pilotage System.

### Bombay Castle, 18th August 1866.

Letter from the Secretary, Harbour and Pilotage Board, No. 137, dated 16th April 1866.

Submits a Memorandum and Resolution by the Harbour and age Board, respecting the improvment and reconstruction of the re system of the Bombay Harbour, and requests early consist the subject. Submits also a scheme by Captain Barker ts from the proposals of the Board.

Letter from Captain E. Giles, I. N., Mister Attendant, Kucrachee, No. 310, duted 22nd May 1866.

Reports on the proposals.

Letter from the Secretary to the Chamber of Commerce, No. 158, dated 27th June 1866.

Submits the Chamber's opinion on the proposals.

RESOLUTION.—Copies of the letters from Captain Giles and the Chamber of Commerce should be sent to the Harbour Board, with an intimation that Government feel inclined to concur in the modifications they suggest in the Board's scheme which, in all other respects, seems a great improvement on the present system.

Government would be obliged if the Board would take the suggestions into consideration, and, if they concur, favor Government with a revised draft of Rules. It is requested that the present system may also be shown in the margin of the revised Rules.

Major,

Acting Secretary to Government.

To

THE PRESIDENT, Harbour and Pilotage Board.
THE SECRTARY to the CHAMBER of COMMERCE.
Captain E. Giles, Master Attendant, Kurrachee.

No. 482 of 1866.

HABOUR AND PILOTAGE Boy,
Bombay, 17th September 15

From the Secretary, Harbour and Pilotage Board, To the Secretary to Government,

### Marine Department.

Sir,—With reference to Government Resolution Marine Department, No. 560, dated 13th August last, I and to state that the Board begs to forward a Minute by their Vices President, Captain Henry, which has the full concurrence of the Board, and in their opinion impets all the points raised by Commander Giles and the Chamber of Commerce. It may be satisfactory for Government to know that the scheme recommended by the Board, and the opinions given in their report, were framed upon the evidence of a number of Commanders of ships in the Harbour and of the most experienced Pilots in their service.

The Board are of opinion that this subject has been very fully discussed, and that immediate action should be taken, and they urge upon Government the necessity of issuing immediate orders.

I have, &c..

(Signed) HENRY MORLAND, Lieut., late I. N.,

Secretary.

### MINUTE BY CAPTAIN HENRY.

Letter of Captain E. Giles, I. N.

Paragraph 3. The Sub-Committee entertain no doubt as to the ability of the Schooners the Board propose building being able to maintain their position off the Harbour during the South West monsoon.

he winter months off the coast of North America, where the her is much heavier than it is here in the South West monsoon.

Of course, in a cyclone or very heavy gale of wind the oners will be obliged to run into Port. But in such weather essel ought to try and make the Harbour.

Paragraph 6. The Sub-Committee do not consider that the ly free system could be worked with advantage in this Port, collowing reasons:—

The description of vessels which it will be requisite to able the Pilots to keep off the Harbour during the South West monsoon are too expensive for men of the Pilot class to purchase or build.

2nd.—The free system only answers well where competition is great. This can never be the case with Europeans in India, and the Sub-Committee would not recommend the admission of Natives into the Pilot service. Moreover they are afraid that the entirely free system would remove the Pilots very much from proper supervision, which they consider would seriously damage their efficiency.

Paragraph 8. If Captain Giles had read paragraph 20 of the Board's scheme for the re-organizing of the Pilot service he would have seen that the earning of each Schooner is to be divided amongst her Pilots only, and not to be lumped for the whole service.

Paragraphs 9, 10, 11, 12, 13, 14, 15, 16, 17.

In answer to the objections contained in the above clauses as to the Schooners, and to Captain Giles' opinion expressed on the present Pilot Boats.

The Sub-Committee can only refer to the very voluminque evidence already taken which they think fully confirms their first recommendation.

The remaining clauses of Captain Giles' letter contain his proposition for working the Pilot service of this Port. The Sub-Committee consider his plan would be an improvement on the

present one. But they do not think it as good as mended by the Harbour and Pilotage Board.

They are of opinion that no matter what exertions the, would use, they could not with their present boats in the 5 the West monsoon keep outside the Harbour, or get there in sufficient time after inward bound vessels are signalled from the Light to board them before they have passed the principal dangers entrance of the Port.

### Letter of the Chamber of Commerce.

The Sub-Committee do not consider that the share ings of the Pilots proposed to be retained by the Board is too large for the following reasons:—

1st.—To give a large proportion of the earnings to be divided amongst the Pilots, would pay them considerably beyond the amount which the standing of this class of men generally receive for similar work.

2nd.—In the event at any future period of the number of Pilots having to be increased, it will be necessary for the Board to make provision for the increase out of the Board's share.

3rd.—The Board will have to spend a large sum yearly towards paying the Probationer Pilots, keeping up Master Attendant and Harbour Cutters, and doing any extensive repairs that the Schooners may require. As of course the Pilots can only be expected to do the ordinary repairs.

4th.—As the Sub-Committee consider that all the Port Dues should be expended on wharfs, light-ships, buoys, anchor boats, &c., they do not think that a smaller sum than that proposed to be retained by the Board will cover the incidental expenses connected with the Pilot service.

The Sub-Committee consider that the scale of pay proposed for the Pilots is quite ample and more than quadruple what this class of men would have received, had they not entered the Bombay Pilot service. Moreover in nearly all instances it is higher than their present salary. In support of the first reason given, the Sub-Committee beg to had the following table, showing the pay generally received by hof the upper Class of Nautical men:—

Goyal Navy.—When on full pay, Commanders £365 per year;
Lieutenants £200 per year; Masters average £300 a year;
Sub-Lieutenants £91 a year.

Late Indian Navy.—Commanders Rupees 422 per month;
Licutenants 120 and 150 per mensem; Masters 175 per connorth.

Merchant Ships employed in the Country Trade.—Captains from Rupees 150 to 300 per month; Mates from Rupees 100 to 150 per month.

Merchant Ships sailing from English Ports.—Captains from £200 to £400 per year; Mates from £98 to £120 per year.

Liverpool Pilots.—Average about £200 per annum.

Thus it will be seen that the scale of pay proposed for the Bombay Pilots is far in excess of any of the above.

The remark of the Committee of Chamber of Commerce that Rupees 45,000 is too high a sum to pay for each of the Schooners may be correct. But in calculating this as their cost, the Sub-Committee wished to make an outside estimate, and one which would cover all expenses.

It must also be borne in mind that vessels for this particular service must be of a very superior build, and fitted with all the most recent improvements, which will make them much more expensive than ordinary merchant vessels of the same tonnage.

G. F. HENRY, Vice-President, Harbour and Pilotage Board.

(True copy)

HENRY MORLAND, Secretary.

#### No. 692.

### Bombay Castle, 3rd October 1866.

RESOLUTION.—As the Harbour and Pilotage Board after ful consideration adhere to their original plan without modificit is sanctioned, as His Excellency in Council thinks that a pitrial is the only conclusive test of the soundness of the argument.

The whole correspondence on the subject will be r volume of Government Selections, and copies will be Harbour Board and the Chamber of Commerce.

## PREFATORY LETTER.

HAVING, at the desire of Government, conveyed to me in graph 3 of its letter No. 2262 of 1866, completed an Ab the Reports of the Proceedings and Reports of the Ir Sanitary Conference of 1866, I now have the hon preface, to offer the following remarks regarding the pracapplication of the suggestions of the Conference.

- 2. With the view of extinguishing Cholera at its sources, it is desirable to ascertain the special conditions under which the disease is produced, and, as a preliminary, the precise spots where Cholera is endemic have to be found. This, as the Conference states, is a statistical inquiry.
- 3. The investigation must necessarily be a work of some years' duration, where there have not already been any trust-worthy observations recorded. But in the Island of Bombay a methodical registration of deaths, and their causes and localities, was begun in the year 1848 for the particular purpose of discovering the seats of endemic diseases. The registration has been continued on the very same plan until now, and there is, therefore, in existence a series of recorded observations extending over nineteen complete years. The entries in the register have been tabulated yearly, to show the sections of the town and island in which the casualties happened; but not only the section but even the street in which the fatal disease occurred may be traced in the register.

4. A retrospective search in the register would be attended we considerable trouble, and it may be preferred to begin a tabulation of Cholera deaths. It is desirable that every or sub-section of the Island should have its table, in which the lera deaths should be entered, not only according to the street but also according to the numbers of the houses in which the place.

In order to trace disease to its source in all parts of this a mortuary registration was begun in the year 1864, s of the first complete year were tabulated at the class of 1865. While the work was new, returns according to entire Collectorates only were asked for, but when those who prepared them had become accustomed to the work, returns from the smaller territorial divisions of Talook were requested, and they are now being supplied.

- 6. When, from habit, the rendering of these also ceases to be troublesome, it will be desirable that all towns and villages above a certain size, perhaps those with 5,000 inhabitants, should furnish separate returns. But, in order that the Urban returns may be satisfactory, it is necessary, to carry out the recommendation that has before been made, that burials and cremations be restricted to defined spots under the supervision of the Police.
- 7. A question has been proposed by the International Conference as to whether the outbreaks of Cholera at places of pilgrimage or fairs are due to the disease being endemic there, although for a time latent, or to its being imported into the place by the assembled people. To aid in solving this question, returns of deaths, according to the form now used in the Talogk, should be at once required from each of the chief places of pilgrimage. In the mean while those returns should be rendered in addition to

the general returns of the Talook. The Talook returns should continue, as now, to include every death, whether in town hamlet. These special returns from places of pilgrimage symbols show the deaths in each section of the town in the way the Collectorate returns show the deaths in each Talook.

- 8. I would propose that such monthly returns show forwarded to the Sanitary Commission from the following and villages, which, besides having large concourses of r have a considerable resident population. From Alur and Jejooree, in the Poona Collectorate; from Sh Pundhurpoor; from Shiralee and Shignapoor in the Satara Corlectorate; Kalkapoor, Sungum and Hyperghee, under Kuladghee; Parola, Alumnair and Nundborbar, in Khandesh; Dakoor in the Kaira Collectorate; Sookulteerth under Broach; and from Nurgoond and Hoolgoor under Dharwar.
- 9. When it has been ascertained that Cholera is endemic at any place, the recommendation of the Conference should be followed by searching if the place has any exclusive peculiarities; also if Pettenkofer's conditions are present. The nature of the soil and the subsoil, as to porosity or tenacity, should be carefully examined, and there should be a weekly register kept of the measured distances of the surface of the water in the wells from the surface of the ground. The observations on this point are required to show if the outbursts of Cholera are consequent on a change in the level of the subsoil waters, as alleged by Pettenkofer.
- 10. A return showing the presence or absence of Cholera at the assemblages of pilgrims was obtained for 1865. A similar return is expected for 1866, and it is advisable that a like return should be rendered yearly by Magistrates.

- 11. It is desirable that facts tending to elucidate the length be term of incubation of Cholera should be recorded. To be y value they should be scrutinized with care, and with an gence such as can be expected only in an experienced at man, and in one who can divest himself, during the intion, of preconceived notions. All well authenticated facts be communicated to the Sanitary Commission, to be accumulated to the sanitary Commission, to be accumulated to the sanitary commission. This is a twill have to be carried out with the assistance of the partment.
- Another point of some importance, as bearing on the selection of attendants for the sick, is to ascertain the comparative immunity from Cholera that is given by a former attack of the disease. This also requires the aid of the Medical Department, as it can be investigated only in regimental hospitals. A register should be prepared in which every man's name is to be entered; those who never have had Cholera should be classed in one column, and in another column those who, on undoubted grounds, can be said to have had Cholera. From such a register it could be found, on an invasion of the disease, what was the percentage of attacks in the two classes. It is chiefly from the Native branch of the Army that information on this point is to be expected, as in it the men are, from their longer service, more often exposed to epidemic visitations than those of the European branch, whose service in India is now but short. But in European as well as in Native Military Hospitals the register of men who have, and who have not, had Cholera should be at once prepared. At the close of every year a return should be sent

# to the Sanitary Commission in the following form:-

# Cholera Return of Buttery or Regiment for the year 186

Men who never before had Cholers.			Men who had Cholera before,			
Strength,	Admitted with Cholera,	Died of Cholera,	Strength.	Admitted with Cholera,	6	
					*	
					•	
					,	

- 13. Much might be done, under intelligent direction, to destroy the germs, if such there be, of Cholcra by the use of powerful disinfectants; and the present time, when the number of cases is unusually small, affords an opportunity of combating the disease in this way in Bombay. There are abundant means of obtaining intelligence of casualties there, and there is an organized Health Service for the town.
- 14. In order to lessen the evil influence of pilgrimages in disseminating Cholera, the Conference advises that, if possible, the numbers be restricted, by obliging the pilgrims to obtain passes that should be granted only to those who have sufficient means for the journey. This would be of little use, even if admissible, as in pilgrimages in this part of India the distances travelled are not usually very great, and the expenses are but small.
- 15. The Conference recommends the extension and perfecting of the hygienic measures already in practice. This has from the first been kept constantly in view in this Presidency. In advancement of the sanitary improvement of the places visited by pilgrims, it is desirable that, in order to carry out such improve-

ments as are being effected at Pundhurpoor, the town or village in fight the temple stands should be brought under the provisions.

Municipal Act XXVI. of 1850, to enable it to raise the ite revenue by such a tax on the pilgrims as is levied at jurpoor, to be expended, as it is there, solely for the sanitary vement of the town and its neighbourhood, and the health lifety of the pilgrims.

Neither in the Dharwar nor in the Kuludghee Collectorat present a Municipal Corporation at any of the places course. In the latter Collectorate especially, where there are seven great pilgrimages every year, and where at five of them the numbers range from 40,000 to 75,000, sanitary measures should be speedily introduced.

- 17. The International Conference advises, when Cholcra is among the pilgrims, not to allow the return of the contaminated mass (if practicable) until after the cessation of the epidemic and a general disinfection. While suggesting this, it at the same time acknowledges that at large pilgrimages it would be altogether impracticable. Not only would such a measure be impossible, but it would also be impracticable to defend every village or town from the entrance of returning pilgrims contaminated with Cholcra. From small cantonments, where military law and military patrols could be made available, the exclusion of the infected has sometimes been tried to be enforced, and it always should be so. From towns also they should be kept out, if practicable, and, where there are Municipal funds to employ, shelter outside the town should be provided for those kept there under treatment, or under observation.
- 18. Direct preventive or restrictive measures against the assembling of pilgrims would not be generally practicable, yet there might be occasions on which the Magistrate might, in the exercise

of a wise discretion, forbid for the time, with the sanction of Government, an assemblage at a place where Cholera was then sent, or might forbid the people of an infected village joining concourse. This measure was recommended in the beginn last year, when the Cholera wave from Mysore was entering the Southern Muratha Country.

The sanitary condition of Native passenger ves. 19. their departure from the ports of Bombay has been the sulseveral representations since the beginning of 1866, and gestions that it has been thought necessary to make fe ment of Act XXI. of 1858 are now under the consider Legislative Council of India. The propositions made are that every passenger should have at least the very moderate allowance of twelve feet of deck surface and a cubage of seventy-two feet; that in large vessels a surgeon or medical man should be included in the ship's complement; that a more liberal stock of water and other provisions should be carried; that certain specified means to ensure thorough ventilation between decks should be enforced; that in harbour no one with any daugerous infectious disease should be taken or allowed to remain on board; that before proceeding to sea the ship and all on board be inspected, as to health and cleanness, by a Medical Officer appointed by Government to such duty, and that the Inspecting Officer should cause to be landed every one found suffering with Cholera, Small-pox, or Fever that there was reason to apprehend would by infection prove prejudicial to the health and safety of others on board, or at the port of destination; that the inspecting Medical Officer should be empowered to disinfect the ship and the bedding and clothes of those on board, and that when the sanitary condition of the ship and the health of all on board was satisfactory he should grant a certificate to that purport. It was proposed that the bedding and clothes of those who had died or recovered from an infectious

disease on the passage should not be allowed to be carried into pert, but should be destroyed; that the surgeon of the ship should a register of the sickness and deaths during both outward and voyages; and that not only vessels carrying thirty or more gers, but every vessel carrying passengers to the Persian Gui or the Red Sea, or to Arabia or Africa, should be brought isanitary supervision.

These hygienic measures for the shipping, that have en proposed, will, if sanctioned by the Government of neet what is now found to be recommended by the There are, however, other suggestions that it is desirable should be adopted in amending the Act: they are that the Native Passenger Act, or what is to be substituted for it in the new Shipping Act, should be made applicable not to British vessels only, but to vessels of all flags without distinction, and that there should be some provision in it to prevent the contravention of its purpose by the masters of British ships in foreign ports.

- 21. The amendment of the Act that has been suggested to Government implies the employment of an Officer of Health for the harbour. This is an appointment that is of great importance, and it will be rendered imperative when the quarantine rules proposed by the Conference are put in force by the Governments that sent their representatives so Constantinople, as Bills of Health will then have to be granted to every ship leaving for a Persian, Turkish or Egyptian port.
- 22. The Conference states that the Moosulman law requires that whoever undertakes the pilgrimage to Mecca shall have means sufficient for the expenses of the journey, and for the subsistence of his family in his absence. No reference is given by which the text of the law can be found, but, as the Moosulman delegates who were present assented when this was put on record, it is most pro-

bably correct. The question might be referred to the Muhumudan Law Officers of Government, and, if it is found that the statement correct, it appears to be highly advisable that the law should put in force, because many destitute persons and beggars con Bombay to embark for the Huj.

23. It is not enough that the Indian places of pilgrim British territory should be under Sanitary Police rules; it is est for the welfare of all, that those also in the neighbouring t of Native rulers should be kept in a healthy conditional British subjects may not be exposed to danger through break of Cholera in these assemblages. This may, perhaps, effected by due representation of the apprehended evil, otherwise intercourse between the two-territories should be prohibited during the continuance of the pilgrimage, or other assemblage. Oonaee, with its hot springs, near Surat and in the Baroda territory, is an instance that has been specially brought to notice, and it is very desirable that the Sanitary Police of that place should be rendered efficient.

A. H. LEITH,

\* President of the Sanitary Commission.

Poona, 23rd January 1867.

# **ABSTRACT**

OF THE

## PROCEEDINGS AND REPORTS

OF THE

# INTERNATIONAL SANITARY CONFERP.

OF

# 1866.

The International Sanitary Conference, proposed by the French Government, for the purpose of finding practical means of preventing future invasions of Cholera, and to which the Ottoman Government had invited the Governments of Austria, Belgium, Denmark, France, Great Britain, Greece, Holland, Italy, Persia, the Papal States, Portugal, Prussia, Russia, Spain, Sweden and Norway, and the United States of America, to send representatives, was opened on the 13th of February 1866 at Constantinople, in the Palace of Galata Serai, by His Highness Ali Pasha, Minister for Foreign Affairs of his Imperial Majesty the Sultan.

The following Delegates took part in the Conference. On behalf of

#### Austria-

M. Vetersa, Counsellor of the Internunciatory.

Dr. Sotto, Physician to the Internunciatory and Director of the Austrian Hospital.

Dr. Polak, formerly Physician to His Majesty the Shah of Persia.

#### BELGIUM-

Le Comte de Noidans, Secretary ef Legation.

#### DENMARK-

Le Chevalier Dumreicher, Consul General and Diplomatic Agent at Alexandria.

Jo e Comte de Lallemand, Minister Plenipotentiary. Fr. Fauvel, Sanitary Physician in France.

BRITAIN-

he Honorable M. W. Stuart, Secretary to the Embassy.

1). 'r. Goodeve, Surgeon Major of the Indian Army, Honorary Physician to the Queen.

D. Dickson, Physician to the Embassy, British Delegate to the Constantinople General Board of Health.

ಪ್ರತಿಷ್ಟ್ರಿ 🥞

M. Kalergi, Secretary of Legation.

Dr. G. A. Maccas, Chief Physician to the King, Professor of Chemical Medicine at Athens.

#### HOLLAND-

M. Keun, Counsellor of Legation.

Professor J. Van Geuns.

Dr. Millingen, Delegate to the Constantinople General Board of Health.

#### ITALY-

M. Alexandre Vernoni, Chief Interpreter to the Legation.

Professor Frederico Bosi.

Dr. G. Salvatori, Italian Delegate to the Constantinople General Board of Health.

#### PAPAL STATES-

H. G. Monseigneur Brunoni, Vicar Apostolic.

Dr. Ignace Spadaro

#### PERSIA-

Mirza Malcom-Khan, Aide-de-Camp General to the Shah, Counsellor of Legation.

Dr. Sawas Effendi, Health Inspector at Constantinople, Persian Delegate to the Constantinople General Board of Health.

#### Portugal-

Le Chevalier Pinto de Soveral, Diplomatic Agent.

Dr. B. A. Gomez, Physician to the King.

#### PRUSSIA-

M. H. de Krause, Secretary of Legation.

Dr. Mühlig, Physician to the Legation, Principal Physician to, Ottoman Naval Hospital.

#### Russia-

Dr. Pelikan, Counsellor of State, Director of the Medical Diment in Russia.

Dr. Lenz, Counsellor de Collège, Assistant to the Minister fé Home Department.

Dr. Bykow, Counsellor of State, Colleague of the Army M' Inspector Wilna.

#### SPAIN-

Don Antonio Maria Segovia, Consul General.

Dr. Monlau, Member of the General Board of Health in Spain.

#### SWEDEN AND NORWAY-

M. Oluf Stenersen, Chamberlain to the King, Secretary of Legation.

Dr. le Baron Hübsch.

#### TURKEY-

H. E. Salih Effendi, Director of the Imperial School of Medicine, Chief of the Civil Medical Service.

Dr. Bartoletti, Inspector General of the Ottoman Sanitary Service, Member of the Constantinople General Board of Health.

### (For Egypt.)

Dr. Salem Bey, Professor of Clinical Medicine and Pathology at Cairo.

After a short address by His Highness Ali Pasha, rules for conducting the business of the meetings were adopted, and in these it was laid down that the decision of all questions should be by absolute majority of votes, and that no nation should have more than two votes.

A Commission was then appointed to draw up a scheme of the work to be done by the Conference. The Members were His Excellency Sahib Effendi, Drs. Sotto, Monlau, Le Comte de Lallemand, M. Vernoni, Mirza Malcom-khan, Drs. Goodeve, Mühlig, Pelikan.

Dr. Fauvel, in the name of the French Delegates, proposed a measure, which, on account of its urgency, should have the rity of other business, that, with a view to prevent a fresh ion of Cholera into Europe, should Cholera appear this year the Mecca pilgrims, all maritime communication between the rabian Ports and the Egyptian Coast should during its conce be cut off, the caravan road by the desert of Suez being aft available for the return of the Egyptian or other pilgrims. In Journey by the desert was viewed as equivalent to undergoing time.

cacy, and partly because of its alleged inhumanity in iorcing on the pilgrims the alternative of remaining exposed to the dangers of the epidemic, or undertaking a journey through the desert, for which they had provided neither supplies nor carriage. The practical difficulties in carrying out the proposal that presented themselves were urged by the representatives of the Turkish Government.

This measure occupied the Conference at its four following meetings, and was at last carried by a majority of votes, the dissentients being the representatives of Great Britain, Russia, Turkey and Persia. Another meeting was held to discuss the rules that should be adopted for carrying out the blockade of the Arabian and Egyptian coasts, if Cholera were reported to be among the pilgrims.

At the seventh meeting of Conference, on the 8th March, the Committee that had been appointed to prepare, a scheme of the work to be done, submitted its report.

The Committee stated that, before entering on the practical points, it was necessary to consider certain preliminary questions of a more especially medical kind, such as the origin and mode of propagation of Cholera, and particularly to determine what positive knowledge there was of the subject, while it left for the study of scientific bodies all that was foreign to the practical end that the Conference had to keep in view. The Committee had arranged the prospective labours in three groups—the first embracing the question of the origin and generation of Cholera; the second that of its transmissibility its propagation; and the third the important question of priction. Each of those groups included certain questions for the attention of the Conference; not to limit its inquiries, but them such a direction as would lead surely and readily to a tical result. The Commission allowed that very probably a of the questions could not be satisfactorily solved in the protate of our knowledge, but thought that even a negative would have its value in practice, because the disclosure was uncertain would lead to the choice of the more tion on which to build.

Details of the proposed scheme were given in the Report, but in the subsequent discussions in Committee it was found to be necessary to depart from the order first proposed, and to modify the questions, so as to allow of greater precision in the elucidation of the points at issue.

The Conference appointed a Committee to report on the several questions included in the two first groups, and, as the subjects were almost purely medical, the Medical Delegates were requested each to take his share in the labours, while the Diplomatic part of the Conference was to be represented in the Committee by three of its number.

The Committee having chosen Dr. Bartoletti President, and Le Comte de Noidans and Baron Dr. Hübsch Secretaries, divided itself into six sections or sub-committees, each having its particular task.

After many meetings to discuss the work of the various sections and to incorporate the whole, the Committee submitted its Report to the Conference in May, and after it had been under examination at many meetings, it was, with a few modifications and additions, adopted by that body on the 2nd of July. The following is an abstract of the approved Report on the first group of questions.

### ABSTRACT OF THE REPORT

ON THE

# IGIN AND GENERATION OF CHOLERA

AND ITS

# 'CITY AND EPIDEMICITY IN INDIA.

THE Committee expresses its regret that those questions which it was of most importance to solve, remained unsettled from want of sufficient recorded information, but states that it had been able to answer categorically many of the questions that had been proposed, and also to frame in precise terms the problem, the solution of which was of interest to the whole world.

Question 1st.—Whence comes Asiatic Cholera? Is it indigenous?

In what countries is it now endemic?

It is beyond doubt that, from the time of the first establishment of Europeans in India, a disease having the greatest analogy to the Cholera of our day, was sometimes prevalent there and in some neighbouring countries, in a severe epidemic form. Without going farther back than the latter part of last century, regarding which reliable information does exist, several epidemic visitations of the disease were noted in different parts of India, and in provinces in some instances very far apart; such were the epidemics observed in 1783 at Hurdwar in the north of India, and at nearly the same time in Travancore, at the south of the Peninsula.

But from the end of last century, whether the disease was altogether extinguished, or rather that it escaped the notice, medical men owing to its little importance, there was no mer made of epidemic Cholera in India, or elsewhere, until 1817. the English physicians in Jessore, who for the first time the with the epidemic form of the disease, believed they had a malady to deal with.

Whether the disease of 1817 was or was not the sat that of former epidemics, it was from that year that a new in the history of Cholera began. Instead of being confinclocalities of its outbreak, it assumed an invasive characover the greater part of India, and passed beyond its lithe outlets that gave passage to streams of human beings.

For several years the disease died out before it had proceeded far, but at last it found a way by the north-west, by which it travelled, until in 1830 it made itself known in Europe. It had appeared for a short time in Astrakan in 1825. This epidemic died out in all parts of the world which it had visited, excepting India and its neighbourhood, where since 1817 it has not ceased to exist.

From this permanent source have flowed repeated epidemics of Cholera, which have followed the most ready routes. That of 1847 entered Europe by the Caspian and Black Seas, while southward it stopped in Mesopotamia and the Hijaz. In 1865, by aid of more rapid transport, the disease arrived quickly by the shortest route on the shores of the Mediterranean.

Without hesitation it is replied by the Conference that the Asiatic Cholera, which has several times spread over the world, is indigenous in India, where it had its birth, and where it exists permanently as an endemic.

Question 2nd.—Is Asiatic Cholera endemic anywhere out of India?

No proof has been shown of Asiatic Cholera having ever had any other point of departure than India, and it is probable that in no other country does it exist as a permanent endemic, peable of spreading in an epidemic form; but it is thought right hake a distinction between the countries in the neighbourhood haid, such as Indo-China, China, the Indian Archipelago (extended to the Dutch possessions), Afghanistan, Beloochistan and the instern and southern coasts of the Arabian Peninsula, regard-like there is not sufficient information, and the countries into it has undoubtedly always come from without, such as the chief the Caucasian provinces, Turkey in Asia, all the North ica, and the two Americas.

Conference distinguishing between primary and seirces, more or less persistent, considers as demonscrated that invasive Asiatic Cholera is never developed spontaneously, and has never been found to be endemic in the countries of the latter category. As to the countries in the neighbourhood of India, while admitting the probability that Cholera does not exist in them as an endemic, it cannot be formally concluded that it does not.

This was agreed to by all, except two.

QUESTION 3rd.—Is there not reason to fear that Cholera may become naturalized in our (European, &c.) countries?

The reply to this can be but doubtful. If it is borne in mind that the epidemic of 1847 lingered longer than the preceding, and furnished secondary sources of the disease in some localities—St. Petersburg for example—it appears likely that by repeated invasions the principle of the disease may in some manner be naturalized.

The Conference, without rejecting the possibility of the occurrence, regards it as problematic.

\*Question 4th.—Is there in the Hijaz an original source of Cholera, either permanent or periodic?

There was no mention of epidemic Cholera in the Hijaz before 1831, nor was there a name for it there, before the invasion of that year. Since then it has frequently appeared, and there are particular notices of epidemic visitations of it in 1835, 184 1847, 1848, 1859, and years following, up to the great epidem 1865. The presence of Cholera at Judda every year, at the of the return of the pilgrims, from 1859 to 1864 is attested Report of the English Consul at that port. If to these cinstances it is added that the manifestation of Cholera in the has always been coincident with the season of the pilgrimage the opinion," general in the country, is that it is always importably in 1865, as is averred, arrivals from India afficholera entered the Hijaz before the disease had yet itself there, the conclusion is arrived at that Asiatic Control appear to have an original source in the Hijaz, but that it appears to have been hitherto always imported there.

This conclusion was adopted by a majority of the Conference. Dr. Goodeve thought that the facts stated did not suffice to establish with certitude the alleged importation in 1865. On the other side it was said that the conclusion was not affirmative; it merely stated a probability, and not a certainty. Dr. Millingen, while mitting that the repeated importation may be due to arrivals from India, disputed that the importation was invariably and exclusively by pilgrims, and consequently that the importation always coincided with the pilgrimage. In 1846 the epidemic at Judda and Yambo occurred in May, that is six months before the pilgrimage, which in that year was in November. There was, however, in May the great yearly Fair, to which Indian and other merchants flock.

QUESTION 5th.—Are there certain localities in India where alone
Cholera is engendered, or which are particularly
favorable to its development? In other words, is
Cholera endemic in all parts of India, or only in
certain districts, which it is possible to circumscribe?

Observations have proved that Cholera reigns by preference as an endemic disease, with a tendency at certain times to

assume an epidemic form in all Bengal, but chiefly in Calcutta, with less severity at Cawnpoor and Allahabad, and their bourhoods; and as regards the rest of India, at Arcot near as, and at Bombay.

in hidras, Conjeveram, Poorce, Tripetty, Mahadeo, Trivellore, ther places where congregations of Hindoo pilgrims take

opears as an epidemic at uncertain intervals, which the most part, exceed four or five years, in the north-Hoostan; also in all parts of the Presidencies of Madras and Bombay, and in Pegu.

To say merely that Cholera is endemic in the valley of the Ganges, and in the Delta formed by that river and the Bruhmapootra, without indicating with more precision the points of that vast extent where it is endemic, is to leave the question in uncertainty. The Conference had hoped to receive official documents fitted to throw light on this chief point in the etiology of Cholera, but it did not receive them, doubtless from want of time to prepare and send them from India.

It will not be enough to know where Cholera now is permanent; it will be necessary also to know if there are spots where the disease has never been absent since it has been studied; if there are places whence it has disappeared again to return; and again what are exactly the localities where it has become endemic comparatively recently, if such there be. Lastly, is it very certain that Cholera is endemic only in the spots indicated, and is there not reason to suspect that it is also so in certain places of pilgrimage where every year Cholera becomes epidemic?

The knowledge of the endemic sources will not be enough. It is of importance to add to that, information as to the principal epidemics which have prevailed in India since 1817, and the points of their departure should be given with all possible precision, in order to ascertain whether or not those epidemics had

their origin in an endemic source, or resulted from arrivals from such a source. It is probable that the Indian records would affed decisive elucidation of this question. It will be interesting know if there are any localities in India that have hitherto resulted propagation of Cholera.

By the aid of such information it would, perhaps, be ble to verify that which we now suspect, that in India ther only a small number of endemic sources of Cholera, from have issued the epidemics that have ravaged first that co and then the world.

It can at present only be replied to the que there are in India certain localities, chiefly in the vame, of Ganges, where Cholera is endemic, without its being possible to particularize all, or to affirm that they exclusively give birth to the disease.

This conclusion was adopted unanimously.

Question 6th.—Do we know the concurrence of causes under which Cholera has its spontaneous birth in India; also the circumstances which make it take an epidemic form?

Nothing has been determined as to the circumstances which may give birth to Cholera, or render it endemic in India.

The hypothesis that it was attributable to the alluvium of the Ganges and Bruhmapootra, rendered particularly deleterious by the fermentation of animal and vegetable matter, also the hypothesis of Br. Bonnafont and others that it was due to the East India Company having allowed the great hydraulic works of the former rulers of the country to fall to ruin, were refuted to the entire satisfaction of the Committee. Dr. Goodeve stated that there were other rivers with similar alluvium without Cholera; that not only since 1817, but from time immemorial, dead bodies were thrown into the Ganges; that the Delta never had hydraulic works. Any ruins of such in other parts dated from the decay of the Moosulman empire and its struggle with the Murathas.

Under the British such works had been promoted. The Comittee thought, as he did, that the development of epidemic Chuin India could not be attributed to any new conditions of abrity, attributable to the negligence of the English adminis-

The hypothesis that would explain the origin and endemined of the Cholera by hygienic conditions which were found in the degree where the disease was not endemic, were not to be sined.

it is proved that the endemic state of the disease is o certain localities in India, and it can be established established that this state is in some manner new, it follows necessarily that this Cholera of recent permanence should be referred to some new and special circumstance in those localities. But it has been said that no new or special circumstance has yet been ascertained in the Delta of the Ganges, since Cholera has reigned there endemically. That, however, still remains a question to be answered. The permanence of the disease in certain places cannot be explained by successive transmissions, but only by something inherent in those places.

The words "has its birth" were objected to but the Conference, nevertheless, unanimously adopted the conclusion that we do not know the special conditions under which Cholera has its birth in India, and reigns there endemically in certain localities.

QUESTION 7th.—What are the circumstances that conduce to the development and propagation of epidemics of Cholera in India?

All that can be affirmed on this subject is, that in Bengal Cholera assumes the epidemic form in the hot season from April to August. In the North-west Provinces the severest epidemics have been chiefly in July and August, and have ended at the beginning of winter. At Bombay, as at Calcutta, the disease has raged principally from April to September. Also in Madras, where the seasons are less defined, it is in the hottest time of the

year that Cholera shows itself epidemically with greatest severity. The hot season is favorable to the development of Cholera, but it is not indispensable to it, and, considered singly, it cannot be read as the cause of the epidemicity.

The circumstances that evidently have a special actic are great assemblages and emigrations of men, and particular pilgrimages that take place at stated times in many parts of Inc.

The pilgrims arrive at the sacred place from all and often after a journey of hundreds of leagues, mad always on foot, during the hot season, and they arrive with fatigue and misery. In the sacred towns their aggravated by horrible thronging; by all the causes of infection that result from it; by had food, had water, debauchery; in a word, by a crowd of circumstances fitted to favor the development of Cholera among them. Then at last, when the multitudes disperse, they go disseminating the disease in their journey, and thus become more or less active agents in the propagation of the epidemic.

It is to be noted that these places are not considered sources of endemic Cholera, and that the disease after the departure of the pilgrims dies out, and re-appears, more or less, periodically only at the time of the pilgrimage. It is very important that inquiry should be carefully made whether or not Cholera is always imported into the places of pilgrimage by persons coming from endemic or epidemic sources. In the mean while, judging by analogy, the probability is that in India, as everywhere else, beyond endemic sources, the importation of Cholera is a condition necessary to its development as an epidemic.

It is impossible not to acknowledge that in India pilgrimages have a chief influence in the development and propagation of Cholera epidemics; then come, but with much less influence, the movements of troops, as observed principally in the Madras Presidency.

If to these causes are added the increasing facilities of rapid communication by railways and by steam vessels, is there not reason to fear an increasing frequency, and a more and more repid extension, of epidemics of Cholera in India, and, as a conservace, an equally increasing danger to Europe of its importation?

In discussing the proposed conclusion, Dr. Goodeve wished

n discussing the proposed conclusion, Dr. Goodeve wished words "one of the most powerful" substituted for the t powerful." The conclusion adopted by the Conference, fer, was that pilgrimages are in India the most powerful of e causes which conduce to the development and to the propa-

#### THE

# TRANSMISSIBILITY AND PROPAGATION

UF

### CHOLERA.

THE SECOND GROUP OF QUESTIONS.

QUESTION 8th.—Is the transmissibility of Cholera now proved by facts that admit of no other interpretation?

THE transmissibility of Cholera is proved first by the progress of its epidemics; whether by land or by sea, its extension has always been in the direction of streams of human beings flowing from a place where it has prevailed. This law of propagation has never been better shown than in the epidemic of 1865.

Imported, as assumed by the Conference, by the Indian pilgrims, it broke out at Mecca during the Courban Bairam in May; it followed the pilgrims in their return by Egypt, and appeared at Alexandria in the beginning of June, after the arrival of the Hajee from Suez by the railway. From Alexandria it radiated in all directions taken by steam vessels, and appeared almost at the same time at Beyrout, Smyrna, Constantinople, Malta, Aucona, and Marseilles, that is to say, wherever the principal streams from Alexandria touched; while it did not yet manifest its presence at any other points of the coast. These ports became new centres, from which the disease propagated itself in different directions, but always in the course of great thoroughfares; and the railways were a means of its speedy conveyance to great distances.

On the other hand, on the return of the Persian pilgrims from Mecca, Cholera broke out at Bussora; and there is some into the believe that the Javanese pilgrims brought it back to grang.

When Cholera has appeared in an island, or in America, it always been first at a sea coast town, and not in the interior country.

The speed with which epidemics of this disease have tracom India to Europe has increased with the increasing
transport. The two first epidemics advanced with a
half, and often retarded by the difficulties of the road,
while that of 1865 came with prodigious rapidity, yet never faster
than the means of transport in use. It left Mecca at the end of
May, and reached America in October. The time of transit from
the Moosulman sacred places to Paris was but three and a half
months.

The Conference was of opinion that all the facts hitherto ascertained demonstrate that Cholera is propagated by man, and with a speed proportioned to the amount and rapidity of his emigrations.

Secondly—It is proved by facts establishing the propagation of the disease by importation. We need not seek the facts in the great centres of population on the European Continent, where the movements of the people are so multiplied and complicated that it is almost impossible to follow closely the connection of circumstances. The conclusive facts are chiefly furnished by small localities and sea-ports, where the arrivals are easily controlled.

The Committee brought forward instances connected with former, as well as the most recent, epidemics, and, among others, those noted regarding the importation of the disease at Constantinople, Borchi, Altenbourg, and at Theydon Bois in England.

Thirdly—It is proved by the progress of epidemics of Cholera in affected localities. This class of proofs does not really differ

from the preceding; it is the verification of the transmissibility by the way in which the disease, once manifested, diffuses itself.

It is a rule, resulting from observation, that an epid of Cholera does not at its outbreak appear simultaneous many places in the same territorial limits, but begins at one only. Published reports of the progress of Cholera are quin illustration by the Committee.

Fourthly—By proofs taken from the efficacy of certain ventive measures, such as rigid separation, and, above all, t' pension of communication by sea with infected places, of the success of these measures are given, and the unanimously adopts the conclusion that the transmit.

Asiatic Cholera is incontestable, and is proved by facts that admit of no other interpretation.

QUESTION 9th.—Are there any conclusive facts that constrain us to admit that Cholera can be spread to a distance by certain conditions of the atmosphere, by winds, or any other change or modification of the air?

The question is repeated by the Committee in other words—Can the atmosphere serve as a vehicle for the principle of the disease, and carry it to a distance?

This question, it says, is of great importance, since if the answer were in the affirmative it would follow that quarantine could be of but very questionable efficacy.

For proof at least one conclusive fact is requisite, one which will show the transit of the disease from an infected to an uninfected place without possible previous communication. The Committee states that there is no such fact, and that it has been able to convince itself of the little weight of all that has been asserted on the subject.

It has, doubtless, not always been possible, for reasons given above, to demonstrate the communication between the place

previously and that subsequently infected, but wherever the inpostigation has been made with care, and the conditions of the
postigation has been made with care, and the conditions of the
postigation has previous communication has

postigated by the postigation has been made with care and the condition has been made with the condition ha

cather conclusive fact, then, proves that Cholera has been cather from a distance, from one place to another, by the medium atmosphere alone. Yet it is incontestable that the air is nief, if not the sole, vehicle of the Cholera principle.

en in absence of any authentic fact, one might yet think ation by the atmosphere possible, if it could be proved a ssage of Cholera from one point to another had a line rapid than the means of communication employed by man. But it is a law, hitherto without exception, that Cholera has never advanced quicker than man in his migrations. The Conference unanimously adopted the conclusion of the Committee, that hitherto no fact has proved that Cholera can spread to a distance by the atmosphere alone, whatever may be its condition.

QUESTION 10th.—How is Cholera imported, and what are the agents in its transmission?

From all that has been learnt, there are two things necessary to the outbreak and the spread of Asiatic Cholera in a locality—an arrival from an infected place, and circumstances that favor the transmission. As regards the former, an arrival with Cholera is a complex affair; it includes man and his clothing, personal effects, merchandise, animals, the ship which carries him, and, in short, all that accompanies the man. Is all that constitutes an arrival equally capable of transmitting the disease?

It was a long while believed that the lapse of a few days between the departure and arrival without appearance of Cholera was a sufficient guarantee against the importation of the disease. But well attested facts show that even a long voyage, without appreciable accidents, does not ensure against danger. On the other hand, it is certain that the regular packet boats, that for many years have plied with India, have never imported Cholera

into Suez. Without at present entering into particulars, it may be concluded that, even if every arrival from a country affects with Cholera be not capable of propagating the disease, it is the less prudent, pending fuller information, to consider  $\epsilon$  arrival as suspicious.

# QUESTION 11th.- What are the conditions in which man in Cholera?

There is no doubt as to man being the principal in the importation of the disease. The arrival of a great suffering with Cholera is not necessary for the causing epidemic. A few sick, or even a single case, may sufficient in the situation of the ensuing epidemic. The intensity is influenced by the more or the less favorable conditions of the locality, as a conflagration is not in proportion to the spark that kindles it, but to the inflammability and the quantity of material that it meets with. One person with Cholera may occasion an epidemic.

# Question 12th.—Can an individual with only Choleraic Diarrhoa communicate Cholera?

Authors of high authority affirm, and produce facts which tend to prove, that a person coming from a source of Cholera, and although suffering only with Diarrhæa, may import the disease. The Conference concludes that certain facts tend to prove this, or, in other words, that the Diarrhæa called premonitory may transmit Cholera. But there is no proof that persons apparently in perfect health arriving from a place where Cholera is present can import the disease into a place hitherto exempt from it.

There have been examples that show that Cholera has broken out after the arrival of persons in apparent health. But has it been possible to ascertain, if they were really so, that they had no Diarrhæa? In most cases it would be impossible to ascertain this. Again, supposing that all premonitory symptoms were absent, and Cholera were to break out after their arrival, would it be right to

conclude that those healthy persons had themselves brought the lisease? May they not have brought infected things with them?

The time that elapses between the entry of the supposed me, fie agent into the organism and the manifestation of the first toms of the disease is usually very short. In the immense wity of instances it is a few days, and sometimes it is only a trs. This is put beyond doubt by the first cases after an an of the disease; a few days only, at most a week, passes imported cases and those derived from them. In the immense training an infected place, if Cholera shows itself on board, it is usually during the first days of the voyage, and it is from this generally admitted fact that the five days' observation in quaranting has been adopted. There are, however, exceptional cases, which favor the belief that the incubation may be prolonged beyond twenty days.

The instances of the emigrant ships New York and Swanton are cited from the records of the epidemic of the year 1848, and of the Renown, which sailed from Gibraltar in 1865. But, it is asked, who can be sure that in these exceptional cases there was no Diarrhæa before the attacks? Or admitting that there was none, and if it be proved that goods and clothing brought from a source of Cholera may be the receptacle of the morbific principle and convey the disease, may it not be that the disease was contracted on board during the voyage?

The Conference adopted the conclusion that in nearly all cases the period of incubation, that is, the time lapsed between the moment when a person can have contracted the Choleraic poisoning and the beginning of the premonitory Diarrhæa, or confirmed Cholera, does not exceed a few days; all the cited facts of a longer incubation are referable to cases which are not conclusive either because the premonitory Diarrhæa has been included in the period of incubation, or because the infection may have occurred after leaving the infected place.

# QUESTION 14th.—Can Cholera be imported and communicated by living animals?

The question has two aspects. Are any animals liable have Cholera and to transmit it as man does; or can living animot sick, be the receptacles of the principle of the diseasimport it?

Some authors, deserving of consideration, have no dot to certain animals being liable to attacks that have a great an to Cholera. But their facts are far from being convincing.

A living animal may, by its covering, be a recept. disease.

The Conference concludes that there is no known fact that proves that Cholera may be imported by living animals; but it is reasonable to consider them in certain cases as susceptible articles.

The Members were unanimous as regards the former part. For the latter part of the conclusion sixteen voted in favor, eight voted against it, and three did not vote.

Question 15th. - Can Cholera be imported and transmitted by linen clothing, and generally by things in personal use?

Instances in proof of the proposition are quoted by the Committee. They occurred at Cessantes near Vigo, Moor-Monkton near York, Lustheim, near Munich. The case, which occurred at York, and was related by Dr. Simpson, is given to show that not only may Cholera be so transmitted, but that an article of dress that had been worn by a person suffering under Cholera, when taken, after an interval of ten months, from a drawer in which it had been shut up, reproduced the disease. Also Lebert's case at Lugano, when the wearing of the clothes of a person who had died two months before communicated the disease; and Pappenheim's cases in which lying on beds that had been used by those ill with Cholera had occasioned the disease, when the epidemic had entirely ceased.

The Committee remarks that if these facts—and they might pe multiplied—do not produce absolute certainty, they establish puleast such probability for them as to render them of great [11.3]

The facts are said to prove that in India the encamping grand where there was an epidemic, the ward of an hospital, in, a ship in which sufferers from Cholera had been, may, et certain time and under certain conditions, transmit the

where Cholera is prevalent, do not import the disease. Frere we certain conditions necessary—and they are happily rare—to render things in use capable of importing and transmitting Cholera.

Those conditions are shown in the examples given of the transmission having taken place. The distance of transport has been little; the articles in question have been recently in contact with the sick, or have been soiled with their dejections. But it is evident that such circumstances must be rare as regards the property of travellers. It is not, however, impossible that soiled linen may be shut up in a trunk. When there has been transmission long after the cessation of an epidemic, it has always been when the tainted articles had been shut up, and more or less kept from the contact of fresh air. There are no instances of articles exposed to the free air which beyond a short time (the exact time is unknown) have transmitted Cholera, while there are instances tending to prove that transmission can take place by means of articles kept shut up for many months.

The open air purifies infected articles; and, far from being able to transport to great distances the generating principle of Cholera, the air destroys it rapidly.

The Conference adopts the conclusion, that Cholera can be transmitted by articles of personal property coming from an infected place, and especially by those which have been used by sufferers

under Cholera; and that certain facts prove that the disease may be carried to a distance by such articles shut up from the access fresh air.

QUESTION 16th.—Can Cholera be imported and transmitted by merchandise?

The Committee reports that no instance can be cited proves that Cholera has been communicated by merchandis ported from a country where that disease was preval particular, merchandise imported from India, either be directly into Europe, has never transmitted Cholera. ever, does not prove the impossibility of such an occurrence, especially as merchandise includes articles highly capable of being impregnated with the morbific principle, such as rags, hides, &c. It is unanimously agreed that there are no proofs of the transmission of Cholera by merchandise; a majority of 16 against 8 admitted the possibility under certain circumstances.

It was agreed by several that, instead of giving an opinion regarding merchandise generally, when the absence of all proof was acknowledged, it would be more proper to specify what substances might reasonably be suspected.

The Conference concluded that, until fuller information be obtained, it will be prudent to consider as suspicious, unless in particular and defined conditions, every arrival from a centre of Cholera. The voters were unanimous; Drs. Goodeve, Pelikan and Polak, did not vote.

QUESTION 17th.— Can the bodies of those who have died of Cholera be the means of importing and transmitting the disease?

In Europe, when corpses are carried to a distance, it is with such precautions as remove all fear of danger. In Asia, however, it is customary in many countries, in Persia for instance, to carry the dead to great distances.

Many medical men, who have of late studied the question, are pinion that the bodies of those who have died of Cholera are active agents in its transmission. It has, however, been ved that those who have occupied themselves most with the pathologic anatomy of Cholera, and who have examined hullidreds of bodies, have not been more subject to the disease in others.

The Conference concludes that although it is not proved by ing facts that Cholera can be transmitted by means of such rigis prudent to consider them to be dangerous.

Question 18th.—What influence have the different modes of communication, by land or by sea, on the propagation of Cholera?

A ship, although not the most rapid means of conveyance, is the most dangerous, because it can carry in it all that constitutes a source of Cholera. It can convey an epidemic, and can do so under the conditions of confinement and infection that are most favorable to its transmission.

Railways, although capable of carrying the disease more rapidly from one place to another, are not so likely to propagate an epidemic. It is not very often that Railways convey those ill with Cholera, and those that emigrate by them from an infected place do not usually belong to the class that suffers most from the disease. These circumstances, added to the airing and to all the other circumstances that tend to the extinction of the principle of Cholcra in such a journey, more than counterbalance the danger resulting from the number of the travellers. It ought to be admitted that in certain circumstances, such for instance as the transporting of troops, they might be the occasion of propagating the disease. The conclusion unanimously agreed on by the Conference is, that communications by sea are, from their nature, the most dangerous; that it is they that most certainly spread Cholera; and that then come communications by Railways, as they, in a very short time, can carry the disease to a great distance.

#### QUESTION 19th.—What is the influence of deserts on the propagation of Cholera?

An experience that reaches back to the first appearance Cholera out of India, teaches that a great desert is the best obstacles to the propagation of the disease. Such a deser as never been passed at a leap, and even a numerous caravan confrom a place affected with Cholera has thrown it off by degrits march across the desert, and arrived entirely free from it vided its journey has lasted more than twenty days.

The pilgrim caravan leaving Mecca with Cholera—ar happened rather often—has never carried the disease to Documents prove that when this caravan has quitted McConstant and Cholera in its midst the disease has always died out after a march of one or two weeks. The same may be said of the Mecca caravan which returns to Egypt by Suez; it has never brought Cholera into Egypt, and it has been proved that if in 1831 it was brought there by pilgrims, it was by those who returned by sea, and not by the caravan. The caravan did not not arrive until afterwards.

The same remark is applicable to crossing the deserts that separate Bagdad from Damascus and from Mecca. And also to the deserts of the north of Africa, as verified by Dr. Dickson during the epidemics of 1850 and 1855, when Cholera never extended beyond three stages into the desert. The same, it is said, has been observed in the United States by Dr. Byrne.

It is concluded by the Conference, as the result of experience, that great deserts are a very effectual barrier to the propagation of Cholera; and the Conference notes that there is no instance of that disease being imported into Egypt or Syria by caravans coming from Mecca.

QUESTION 20th.—What is the influence of assemblages or congregations (agglomerations) of men on the intensity of epidemics of Cholera; also on the propagation of the disease? and under what conditions does that influence operate?

In order to answer these questions it is necessary to look at his influence as it presents itself in ships in lazarets, in armies, at is, at pilgrimages, and especially that of Mecca. On the other is, it is necessary to show the effect of dispersion, whether in hishing the intensity of epidemics, or in propagating them. By before entering on the details of these different points, a real answer may be given to the questions. The Conference is unanimously the conclusions that every assemblage of men hich Cholera appears is a condition favorable to the rapid ion of the disease, and if the assemblage is in a bad sanitary to the violence of the epidemic.

proportion to the concentration of the congregated mass, while the violence of the epidemic (all other things being equal) is the greater the less the individuals have already been under a Choleraic influence, or if they remain uncontaminated by it; that is to say, in other words, that those who have already been under the influence of a source of Cholera have a kind of relative and temporary immunity that counterbalances the grievous effects of the agglomeration.

Lastly, that in a congregated mass the more rapidly the epidemic spreads the more quickly also does it cease, unless new healthy arrivals furnish fresh aliment to the disease, and so sustain it.

#### Question 21st.—What intensity and persistence have epidemics of Cholera in ships?

Without doubt, the circumstances on ship board are most favorable to the rapid development and the violence of an epidemic. A narrow space, badly ventilated, the impossibility of sufficiently isolating the sick, and the resulting foul air, make a ship, crowded with men, the medium that is most favorable for an epidemic.

All ships, the crowding being equal, do not run the same danger on an invasion of Cholera. Those that on leaving a source of Cholera have taken on board persons who have resided a longer or shorter time where it has been prevalent, if it breaks out on board, have but few victims, and these during the first days of the

voyage; and if the voyage is long, it dies out and does not reappear. More often Cholera, properly so called, does not manife itself. Instances of this are given by the Committee.

In ships having on board a crew and passengers altoguintainted by Choleraic influence, the epidemic, if it appears, a lopes itself rapidly, and is more extensively fatal than in the forcese. It passes through its phases in a short time, and, to a compoint, in a period proportioned in duration to the crowding of the cubarked. Instances of this also are related by the Committee

Although experience shows the difference in what to on board those differently circumstanced ships, it v dangerous error to conclude that the vessels in which the passes gers and crews have a certain immunity from the disease, bring no danger with them to the ports of debarkation.

The Conference adopts the answers, that the intensity of epidemics of Cholera on board ships crowded with men is usually in proportion to the crowding, and, other things being equal, is more violent when those on board do not come from a residence in a centre of Cholera; that in crowded ships the progress of epidemics is generally rapid; lastly, that the danger of importation by ships, and that of giving rise to a severe epidemic, are not altogether dependent on the intensity, or even the occurrence, of Choleraic casualties that have happened during the voyage.

Question 22nd.—What influence have assemblages in lazarets, of persons coming from a source of Cholera, on the development of the disease among those in quarantine, and those outside the lazarets?

The fear that the disease would commit great ravages in a lazaret is not justified by experience. It happens there just as it does in a ship when the inmates have before entry been under a Choleraic influence. They have a kind of immunity from the disease which, in a vast majority of cases, resists the bad effects of crowding. In proof of this the Committee cites instances furnished by Dr. Bartoletti from the progress of the epidemic of 1865.

The records that are furnished by the Committee of the story of the epidemic in the vicinity of lazarets tend to show a quarantine station brings danger to the neighbourhood.

The Conference adopts the conclusion of the Committee, that the seemblage in a lazaret of persons coming from a place where rera prevails, has not the effect of producing a great increase disease among those in question; but that such an assemblage htwithstanding, very dangerous to the neighbourhood, as it is to favor the propagation in it of Cholera.

'Sonlau declined to vote.

111

Question 23rd.—What influence have great assemblages of men, armies, fairs, pilgrimages, on the development and the propagation of Cholera?

What has been said regarding ships is applicable to all great assemblages of men. When Cholera attacks a body of troops, hitherto untainted by Choleraic influence, it spreads rapidly, and the ravages it commits depend on the sanitary and moral conditions of those attacked. The epidemic runs its course in a short time, although less quickly than in a ship. The epidemic soon dies out, unless new arrivals of troops, as yet untainted, help to revive it. In this case those newly exposed to the Choleraic influence suffer in a proportion much higher than the others who, as would appear, have acquired a relative immunity.

The Committee quotes in support of this, what was observed in the French Army in the Crimean war.

That troops in movement propagate Cholera is well known. The war in Poland in 1831, the Civil war in Portugal in 1833, afford instances of this. During the epidemic of 1847 and 1848 the movements of troops in Russia were often the occasion of bringing the epidemic to places before free from it.

Fairs, like other great assemblages, when Cholera appears, become centres of infection, but, as compared with armies which continue more or less compact, they have the greatly aggravated

evil that the mass affected with Cholera disperses, and spreads it in all directions. The fair of Tuy in Portugal in 1855, that of Samara in the Government of Orenbourg, that of Hurdwal India, and that of Tantah in Egypt in 1848, are given as exart. The fair of Tantah, which took place this year soon after the epidemic of Cholera, had no bad effect on the public health. This tends to corroborate what has been advanced as to the retire immunity of an assemblage which has already been exposed in epidemic of Cholera.

The Conference concludes that great assemblager (armies, fairs, pilgrimages) are among the most certa propagating Cholera; that they form great epidemic sow whether the people march as an army or scatter themselves, as from fairs and pilgrimages, carry the disease into the country they go through; that those assemblages, after having been subjected, in usually a rapid way, to the influence of Cholera, become less susceptible of it, and the disease disappears from among them, it may be even speedily, unless new arrivals come to prolong it.

# Question 24th.—What influence has dispersion on the intensity and the development of epidemics of Cholera?

It has been already shown that the diffusion of sources of Cholera in healthy localities is almost certain to propagate the disease. But, on the other hand, experience proves that the scattering of an assembly, which has been visited with Cholera, is a measure fitted to lessen the violence of the epidemic, and to lessen the number of attacks in the mass, provided that the dispersion has not been too tardy, and that it has taken place at the first appearance of the disease.

The dispersion in such a case lessens the chances of propagation in all the mass attacked; but it is necessary to bear in mind that most frequently, in consequence of the circumstances in which it is carried out, it only retards the progress of the epidemic. On comparing the results we find that in the scattered mass, when the individuals, although more or less separated from one another,

are always in communication, the mortality has been nearly the same as in a compact mass; only it has been extended over a light time. It is evident that in many cases the rapid extinction a epidemic which was committing great ravages in an assemble that has been wrongfully attributed to its dispersion, while the extention was only the consequence of the natural course of Charace epidemics in parallel circumstances.

The scattering, however, when well timed, has undeniably collowed by favorable results, and, if it were only to improve my condition of individuals, it could not be too much

opportune dispersion of an assemblage may lessen the violence of an epidemic of Cholera which has appeared in it, and may even prevent its spreading; but that the dispersion would, on the contrary, cause great danger of propagation if it took place in the midst of places as yet free from the disease.

Question 25th.—What share has the pilgrimage to Mecca had in the epidemics of Cholera that have followed one after another up to this time?

The Committee states that, like all pilgrimages, that to Mecca consists of a congregation of new individuals coming from very different countries, and, consequently, in greater part uncontaminated by Choleraic influence, up to the time of their arrival in the Hijaz. This last circumstance usually makes Cholera, if it appears, pass quickly into a violent epidemic, the more destructive because the assembled multitudes are in untoward sanitary and climatic conditions.

The congregating every year at Mecca of fresh individuals, together with the arrival of pilgrims from contaminated countries, accounts for the frequency of epidemics since 1831.

The dispersion of pilgrims after the epidemic has begun, gives rise to danger of its being propagated, a danger that is the greater

from the rapidity with which the dispersion takes place, and from its being in the hot season. Of five epidemics of Cholera that have desolated Egypt since 1831, only two coincide in time the return of the pilgrims, and they were in the hot season of and 1865.

Twice only, and at thirty-four years' interval, Cholera haven brought to Egypt by pilgrims returning by sea from Mecca, in the interval the disease has many times afflicted Mecca at time of the pilgrimage; but it is noted by the Committee the conveyance of pilgrims from Judda to Suez by steam ver been practised only since 1858. (This shows that for notwithstanding the steam communication, Egypt did nowas not until the eighth year of the use of this rapid means of transport that an epidemic occurred).

The conclusion adopted by the Conference is, that the part borne by the Mecca pilgrimage as an agent in propagating Cholera in the countries bordering on Europe has been the importation of the disease into Egypt twice, at an internal of thirty-four years, during the hot season.

Question 26th.—What influence have the sanitary and other conditions of a locality on the riolence of an epidemic of Cholera; in other words, what are the adjuvant causes of Cholera?

The Committee does not think it necessary to consider at length all the conditions that favor most of the epidemic diseases, but only those that appear to have a particular influence on the development of Cholera.

Indigence with all its debilitating consequences as regards food, lodging, dirt. crowding, &c., renders its subjects more liable to most of the epidemic diseases, but to none more so than to Cholera. After indigence come fatigue, excesses that act in like manner in exhausting the organism, and all those morbid conditions that diminish the vital powers, and particularly those that affect the alimentary canal. Cholera attacks in preference persons debilitated, by whatever cause.

Temperature, Climate—Although Cholera has not been excludneby any climate, it has been ascertained by observation that, hereneral, the more or less rapid course of an epidemic, and its elor less invasive progress, are in proportion to the elevation of he temperature. Thus the hot season accelerates, while winter retitles, and sometimes arrests, the epidemic.

The Committee mentions exceptions to this, as observed at Now and Orenbourg, and in 1830 and 1831 in Russia during old in Poland, when a very severe winter did not stay the graft the epidemic.

mmittee suggests explanations of these exceptions.

Air—There is no doubt that, in general, confined air, or air vitiated by the exhalations of putrifying animal or vegetable substances, predisposes the organism of man to contract Cholera, and thus to render the disease more destructive. In an epidemic confined air acts, moreover, as a vehicle of the Choleraic principle.

Water appears, according to observations made principally in England by Dr. Snow, and in Germany by Dr. Pettenkofer, to contribute, in certain circumstances, to the development of Cholera in a place.

It does so when the water is charged with organic matter, as in rivers that flow through great towns, or in wells which receive the infiltrations of a porous soil, impregnated with decomposing matter, or that are in communication with drains and even privies. The water in this case, as the air in the preceding, serves as a vehicle for the morbific principle.

But according to most German authors, and especially Pettenkofer, privies, drains and the earth itself, are the chief receptacles of the principle of Cholera. The doctrine of Pettenkofer is connected with facts so important as regards prevention that the Committee does not consider itself at liberty to pass it by. The doctrine rests on the proposition, generally admitted, that the alvine dejections of those sick with Cholera contain the principle that propagates the disease. This proposition, already published

by Dr. Pellarin in 1849, who urged the necessity of disinfecting the dejections with sulpliate of iron, was corroborated by observations of Dr. Budd in 1854, and by those of Dr. Sp. then, we may say, it was definitively put beyond doubt by researches of Pettenkofer. He considers it as demonstrated his observations, that in an epidemic of Cholera the earth & of the place where the disease prevails has a great share i development by the emanations that escape from it. that he admits that a porous soil, easily permeable to water air, and charged with excrementitious matters (consequent alluvial soil, a marshy soil) impregnated with Choleraic becomes at first a receptacle, then, according to circu source, more or less active, from which the principle of the disease issues, the activity depending on the level of the subsoil waters, and being therefore dependent on alternations; more or less considerable, of the humidity of the superficial layer of soil. aptness of the soil for receiving the principle of Cholera will explain the tenacity with which the disease clings to certain places, and even its recurrence, apparently spontaneous, after having more or less completely disappeared. It is in India, and particularly in the districts where Cholera is endemic, that the truth of this doctrine will have to be determined. Perhaps it will explain the endemicity. It is a fact well known in India, and of which we find examples in books, that the ground on which soldiers or others affected with Cholera have encamped can transmit the disease.

The Committee adds, whether this doctrine be completely verified or not by all the facts, it appears to be proved that a porous soil, charged with detritus (organic matter), such as is described by Pettenkofer, in short that an alluvial soil, favors the development of epidemics of Cholera; and even if all the epidemics be not explicable by this circumstance, that will not invalidate the rule, but will only prove that other conditions are likewise favorable to the development of Cholera.

The Conference agrees in the conclusion of the Committee that sanitary and other conditions, which in general predispose a

population to contract Cholera, and consequently which favor the invensity of epidemics, are indigence with all its consequences, the examing of individuals, their unhealthy condition, the hot season, levency of ventilation, exhalations from a porous soil impregnated forganic matter, above all if that matter be from Choleraic

deltisions.

That, as it appears to be shown by experience that the dejection of those with Cholera contain the generating principle of the it is legitimate to admit that drains, privies, and the contains of a town, may become agents in the propagation of

That it seems to result from certain facts that the ground of a place once impregnated with Choleraic matters can for a considerable time retain the power of giving off the principle of the disease and of keeping up an epidemic, or even of reproducing it when it has been extinct.

# QUESTION 27th.—What is to be understood of immunity as regards Cholera?

It is the more necessary to consider this immunity since it has been wrongfully used as an argument against the transmissibility of Cholera, and because it leads to points that are of importance in relation to the prevention of the disease.

There is a like resistance in some to all the most contagious or transmissible diseases, such as plague, yellow fever, small-pox, scarlet fever, &c. A well balanced organism opposes to all those diseases an effectual resistance in a great majority of cases.

The principle of a transmissible disease will not reproduce itself, excepting under certain conditions, and without these it is sterile.

Certain countries or localities have completely or partially resisted the importation of Cholera. Among those in Europe which enjoy this immunity are alpine Switzerland. The Commit-

Messrs. Bonbee and Vial, on the influence of certain geological conditions on Cholera, and especially on the repulsive power granitic soil, from which it was deduced that such a soil work obstacle to the development of Cholera. This deduction express, the Committee thinks, a general fact, but which is far from without exceptions. The same may be said of great altitude

Many towns in Europe have resisted more or less the Claric influence, but Lyons merits special mention. This toy a population of four hundred thousand, seems at fir combine all the conditions that are favorable to an Cholera. Situated on the confluence of two rivers, although on one side built on high ground, yet on the other standing on alluvial soil, it has crowds of workmen; the causes of insalubrity and indigence are not wanting; it is on the great thoroughfare from the north to the south of France, and has been a refuge for many fugitives from places where Cholera was prevalent. Yet Lyons has hitherto resisted more or less the Choleraic influence.

The resistance of individuals to Choleraic poisoning is in some complete. The resistance in others may be but temporary, as is observed among medical men, who, over-excited by the sentiment of duty, resist the greatest strength of the disease, but succumb perhaps at the decline of the epidemic when exhausted by fatigue. The past never guarantees a future immunity. The immunity is in proportion to the vital resistance, and this is variable.

It has been observed that in epidemics very strong persons have been stricken beside individuals apparently very feeble, who have been spared. But it is well known that vital power is not in proportion to muscular energy.

Besides the more or less complete immunity proper to every individual, there is also a temporary immunity which a recent subdued epidemic leaves after it.

The Conference adopts the conclusion that the immunity which certain localities enjoy, that is to say, the resistance, perman-

ent or temporary, general or partial, opposed by those localities to statevelopment of Cholera within their bounds, is a fact which does the development of the least all determined, are an obstacle to the development of the distribe. That the more or less complete, and the more or less durable summinity which the greater number of persons placed in a raic centre enjoy, an immunity that attests the individual's ince to the poison, is a circumstance which should be held to the greatest value.

og it with reference to epidemic development, it is correctively by transmissibility, and, as regards prevention, it puts on the way, means fitted to restrain the ravages of the disease.

Question 28th.—From the facts previously established, and which are connected with the generation, the propagation and the transmissibility of Cholera, can we deduce any thing precise as to the generating principle of the disease, or, at least, as to the mediums which serve as vehicles, or receptacles; as to the conditions of its entrance into the organism; as to the ways by which it escapes from it; as to the duration of its morbific activity; in short, as to all the properties a knowledge of which concern prophylaxis?

Although the generating principle of Cholera be called contigium, germ, miasm, and whether it be, or be not, considered an organised substance, it has always escaped observation, it has never been isolated, and it is known to us only by its effects. In this respect it does not differ from other morbific principles. What we do know is that it reproduces itself in man.

In Europe it has never been seen to begin otherwise; it is by successive generations within man that it multiplies and propagates itself; never does the nature of the soil, nor the worst sanitary condition, give birth to it. But at its source in India, where

it is endemic, is this the case? Has the morbific principle its birth there spontaneously, and out of man, under conditions still unknown, and which exist nowhere else? Or, in applying the trine of Pettenkofer, is the soil of the places where the end prevails merely the receptacle of the germs, and has it the perty of preserving them long enough to allow of an incommon disengagement more or less active? Does it never exhaust and before they are renewed? What has been said of the cling the Cholera to certain localities in Europe gives some support to hypothesis.

The principle of Cholera seems indigenous in the Ganges, and it is principally there that on an alluviation, row and humid, it now maintains an endemic form. Are we authorised to conclude that Cholera has a miasmatic origin, and is only a form of palustral disease produced by the marshes of the Ganges? The Committee thinks it is not so. Observation shows that there is no proportion on the banks of the Ganges between the intensity of marsh endemics and that of endemic Cholera; each has its own characteristics, and they have there their maximum of intensity at different seasons of the year. There is another fundamental character which separates Cholera from marsh diseases; it is that the latter commit their ravages on the spot, and the principle which produces them does not reproduce itself within man, and consequently is not susceptible of transmission.

The conclusion as adopted by the Conference is, that in the present of state of science we can announce only hypotheses as to the nature of the generating principle of Cholera; we know only that it is indigenous in certain countries of India, and that it maintains itself there permanently; that the principle reproduces itself within man, and accompanies him in his peregrinations; that it may thus be diffused to a distance from country to country, by its successive reproduction, without ever generating itself spontaneously, apart from man.

The votes were unanimous. Dr. Goodeve declined to vote.

QUESTION 29th.—What are the vehicles of the generating principle of Cholera?

PENOThe Committee in using the word vehicles, means the agents e, are the mediums by which the morbific principle penetrates into one organism. Facts show that the air is the chief vehicle. The apid dissemination of the disease in an affected locality, the sire number in a given assemblage, contact, either mediate or immediate, with the sick is imposthe general influence which at the time of an epidemic weighs
tess on individuals placed within the limits of the source, mstances, added to the facts which show that persons pren with Cholera at a little distance from a centre with which they had no communication, the Committee thinks, prove that the ambient air is the principal vehicle of Cholera. The principle of Cholera must then be volatile, and behave in this respect as miasms do, that is to say, by infecting the atmosphere. Observations show, however, that the Choleraic principle cannot be carried far by the atmosphere. It seems as if the power of the Choleraic miasm, like that of the miasm of typhus, were rapidly exhausted in free air at a short distance from its source.

Question 30th—To what distance from a centre of emission can the principle of Cholcra be carried by the air?

It acts but rarely beyond a very short distance; the Committee says a hundred metres, approximately, (328 English feet), but that in the immense majority of cases the transmission does not take place, excepting at a much shorter distance. But are there any observations that lead to the conclusion that it can act much farther than that from the centre of emission? The occurrences that have been offered in proof of this can be otherwise explained, or they are wanting in important details. In discussing the report Dr. Goodeve wished that it should not be specified that "in the immense majority of cases" the distance at which transmission by the atmosphere can take place is very near the centre.

The Conference adopts the following answers to questions 29 and 30—The ambient air is the chief vehicle of the generating agent

of Cholera; but the transmission of the disease by the atmosphere in an immense majority of cases, is limited to a distance very class to the centre of emission. The instances cited of transport by atmosphere to one or many miles distance are not sufficiently clusive.

The votes were unanimous. Drs. Sawas and Goodeve dec ed to vote.

QUESTION 31st.—What are the other vehicles of the Chiprinciple?

The observations in England seem to place it be that water, whether defiled by Choleraic dejections, or contaminated by the morbific agent diffused in the atmosphere, may serve for the introduction of this agent into the organism.

It is reasonable to admit, although proofs cannot be shown by the Committee in support of it, that certain alimentary substances may become vehicles of the morbific principle.

The Conference unanimously, and all voting, adopted the conclusion, that water and certain ingesta may serve as vehicles for the introduction of the generating principle of Cholera into the organism, that the ways by which the poisonous agent penetrates are chiefly the respiratory, and very probably also the alimentary, passages. Nothing has been ascertained as to entrance by the skin.

Question 32nd.—What are the chief receptacles of the Choleraic principle?

It is in the digestive tube that the generation of the morbific agent appears to be accomplished. Whether it be so or not, it is certain that the matters coming from the alimentary canal of a person with Cholera contain it.

According to the researches of Pettenkofer and of Thiersch, it would appear that the morbific principle exists only in a latent state in fresh Choleraic dejections, and that it is necessary that a

certain degree of fermentation should take place in them for the evelopment of their poisonous power, and for the disengagement the morbific principle. From this theory it follows that what e.c. ers the fermentation of the dejections without destroying the contents to preserve the germ of Cholera, which might subsequently be developed under favorable circumstances.

t is incontestable that the dejections are the first receptacle to morbific principle, and that then linen, clothing, in short t can be soiled by the dejections, and privies, drains, waters, was soil of a place may become secondary receptacles, from remorbific principle may be set free more or less quickly, ar less energetically, according to circumstances.

The Conference concludes that Choleraic dejections being incontestably the chief receptacle of the morbific agent, it follows that all that is contaminated with those dejections also becomes a receptacle whence the generating principle of Cholera may be set free under favoring circumstances. It follows also that the generation of the Choleraic germ most probably takes place in the alimentary canal, to the exclusion, perhaps, of any other part of the organism.

The voters were unanimous: all voted.

Question 33rd.—What is the duration of the morbific activity of the generating principle of Cholera?

According to the Committee, it results from observation that in free air the generating principle of Cholera rapidly loses its morbific power, but in certain peculiar circumstances of confinement the principle may retain its activity during an indefinite time.

There is yet a question as to how long the morbific principle may be reproduced and eliminated by the organism of the sick, or, in other words, how long an individual, with premonitory Diarrhea, or confirmed Cholera, can transmit the disease? This question,

with which the duration of sequestration in quarantine is connected, is difficult to answer, and it was much debated by the Committee.

in

The opinion that the infectious Diarrhæa, in certain case be prolonged for many weeks was urged with much force opposition it was held that the premonitory Diarrhæa last general, scarcely more than three days, and if it did continue it was very rarely that it exceeded a week, and that we may all safety, consider as free from Cholera a person isolated from cause of the contagion whose Diarrhæa is prolonged beyond days after his segregation, without his having present acteristic sign of the disease.

The Conference by a majority adopted the conclusion, that observation shows that the duration of Choleraic Diarrhæa, called premonitory (which it is necessary not to confound with Diarrhæas that exists in times of Cholera), does not exceed a few days. The observations cited as exceptional do not prove that the cases of Diarrhæa which last longer are Choleraic, and are capable of transmitting the disease when the individual has been removed from all cause of contamination. Fourteen voted in favor, and Drs. Gomez, Millingen, Muhlig and Salvatori, voted against it. Dr. Monlau refrained from voting.

#### NOTE.

The Conference deemed it useful to attach to the report a complete view of the doctrine of M. Pettenkofer, as given by Dr. Mühlig:

"The researches of Pettenkofer do not refer to the quality of the soil considered as a receptacle of the principle of Cholera. Pettenkofer had established, what had before been advanced by others, that the quality of the soil of a locality is among the adjuvant causes of Cholera, the most powerful; only he went much further, inasmuch as that he asserts that a soil possessing the qualities that he describes is so essential to the development of Cholera that the Choleraic germ imported into a place the soil of which has opposite qualities will be perfectly innocuous.

"The soil that is favorable to the development of Cholera is, according to Pettenkofer, porous, easily permeable to water and air, charged with organic matter (above all excrementitial), and presents from time to time a difference in the level of the subsoil waters. But the time when the subsoil waters subside, and in consequence a certain relative dryness succeeds to an unusual humidity, will, according to him, be the post favorable for the development of Cholera.

Thus Pettenkofer concludes that two elements are indispensable to the development of the Cholera: first, the importation of the Choleraic germ into the place; second at a soil particularly constituted. Neither the former nor the latter of these elements are suffices alone; both together are required: the person suffering under Cholera furnish the germ, the soil will furnish certain emanations which, in combining of the cherit be in the atmospheric medium, or whether it be in the organism itself, coduce the Choleraic infection."

# PREVENTION OF CHOLERA.

This part of the work of the International Sanitary Conference comprises the Third Group of Questions, and it was entrusted to three Committees, who had to report severally onfirst, the sanitary measures; second, the quarantine; and third, the special measures necessary to be taken in the East to prevent new invasions of Cholera in Europe. In discussing and reporting on the subject of this group of questions, the Committees did not implicitly follow the scheme that was originally sketched, but were guided by a revised classification that, after much disputation, was adopted by the Conference at its thirteenth meeting.

### ABSTRACT OF THE REPORT

ON THE

### SANITARY MEASURES

TO BE TAKEN FOR THE

#### PREVENTION OF CHOLERA.

The Committee was composed of M. Segovia (President), Dr. Gomez, Dr. Goodeve, M. Keun, Dr. Lenz (Secretary), M. Malcom-khan, Dr. Millingen, Dr. Mühlig, Dr. Spadaro, M. Vetsera, Dr. Monlau (Reporter). The Report was dated the 6th August 1866.

The Report after preliminary remarks on the high importance of sanitary art, shows the order in which the measures of prevention are considered. The objects in view being to extinguish, as may be possible, the generating sources of Cholera, to hinder the importation of the disease—to destroy the predisposition of places to receive it—to lessen its ravages when, notwithstanding all precautions, it has entered a place—these ends are to be attained by the sanitary means that are proposed.

I. -The sanitary measures to be taken in places reputed to be permanent sources of Cholera.

To trace the evil to its source, to disclose its extent, to combat it, with energy until it is completely extinguished, is evidently to prevent for ever its return. For this reason the first question is—Are there any preventive measures by which the original sources of Cholera in India might be extinguished?

The Committee explains the acceptation in which it uses the term original source. Every place in which Cholera is permanently established is held to be an original source, or centre, without quiring if the permanence is due to natural conditions of soil climate, or to artificial conditions created by man himself; to need to continual causes of generation, or simply to transmissions foll, red by the disease.

By this way of viewing the sources of Cholera all search special means is rendered unnecessary, and it is requisite to sider only those known hygienic measures that are every efficacious in pestilential diseases, and consequently in to inquire to what extent those measures are applicated already been applied in India, and the results that it is reasonable to expect from them.

The Committee expresses its high appreciation of the information it received from one so competent to give it as Dr. Goodeve as to the difficulties, on one hand, which present themselves in India to the introduction of sanitary measures on a great scale, difficulties arising from the extent of the country, the conditions of the soil, the number of the people, and their intellectual state; on the other hand, as to the extension which the solicitude of the English Government had already given to those measures.

The report gives a simple enumeration of sanitary measures already effected, or in progress, in India, and mentions the permanent Sanitary Commissions of the three Presidencies and their duties—the works at the Presidency Towns—At Calcutta a system of drainage which is under construction, and a scheme of water supply which has been sanctioned; the clearing of the old drains; the improvement of the public latrines and the construction of a railway to carry the filth to a distance; the removal from the town of noxious trades; the prospective construction of a slaughter-house, and the prohibition of throwing the dead into the river—At Bombay, without noticing many other improvements already long realized, a more complete system of scavenging; the removal of the Fort walls; the preparation of an Act to regulate the height of houses; and the ventilation and occupation of houses. (Had fuller

information been furnished from Bombay the Report might have noticed the extensive reclamation of foul foreshore, the system of rage which has been begun, the railway to carry out of the level the daily filth, new markets and a projected slaughter-house, how is visitation, limewashing, and disinfection in epidemic sickness.)

Madras there were a water supply and system of drainage in containing in polation.

In addition to what is noted regarding the capital towns, improvements in other towns are alluded to. The measures he improvement of the health of the troops and canton-

The Report states that the doctrine of the transmissibility of Cholera not having, been recognized in India, as elsewhere, until lately, it is only recently, or since the report of the Cholera Commission of 1861, that sanitary measures have been based on it. It was not until later that the danger from Hindoo pilgrimages was seriously noticed. The frequent importation of the disease into Madras by pilgrims returning from Conjeveram, Tripetty, Trivelore, &c., is quoted from an Annual Report on deaths in Madras. (The Committee, misreading the Returns forwarded to the Conference from Bombay, gives undue credit to sanitary measures, which are supposed to have been successful in warding off visitations of Cholera in the year 1865 from all but two out of ninety-four assemblages of pilgrims in this Presidency.)

The measures to be taken to avoid the dangers of pilgrimage are of two kinds:—first, to hinder the development of Cholera at the places during the concourse of pilgrims; second, to hinder the propagation of the disease by pilgrims on their way back.

With reference to the first of these, mention is made of what had been done at Conjeveram and at some places in the Bombay Presidency. And with reference to the second, the rules proposed by the President of the Sanitary Commission for Bombay, and printed in the Report for 1864, are quoted.

The Committee remarks that the regulating of pilgrimages has to encounter great difficulties when being put in practice, as it is not yet definitively settled. It must be hoped that the arranments will every year be modified as experience may show to useful and necessary.

No one, on examining narrowly all the sanitary measures are being carried out in India, can deny the great and salutar fluence that they must necessarily have on the intensity of epiderin general, and especially on Cholera, in lessening the prediction to infection, and in removing many of the adjuvant the disease.

As these sanitary measures alone will not suffice to extinguish Cholera at an early period, it is meanwhile necessary to guard against its importation, and to oppose effectual obstacles to it. It is very obvious that restrictive measures are indispensable, and that they will continue to be so for a long while.

The Committee hopes that all the Governments that have possessions in India will, for the same humane end, apply in their respective territories, according to their local wants, sanitary measures like those adopted in British India.

In acknowledging and appreciating all the advantages, in part already attained, and in a higher degree yet to be attained, from sanitary measures in India, the Committee concludes that there are no direct means of extinguishing epidemic Cholera at its sources, but it may be hoped that this will be arrived at by measures among which the sanitary will perform the most important part.

The Committee hopes also that the Government of Great Britain will pursue, and even extend, the path of reform, on which it has entered with so much promise; but recommends, above all, that coercive measures be not renounced. The transmissibility of Cholera being admitted, and the slow working of hygienic measures being known, restriction and isolation will be indispensable for a long while to come, at first to hinder importation, which is

always imminent, and then to leave time for sanitary measures to groduce their effects.

II.—Sanitary measures to hinder, as far as possible, the importation of Cholera by sea.

After having hindered, as much as possible, the production of civil, it is necessary, as long as it will reproduce itself, to bar its lage and prevent its importation, especially by sea, which while most dangerous way of communication, yet is also that laws of the most effective precautions.

In the British Navy the mortality, which sixty years ago is said to have been from 91 to 125 in a thousand, is now but 11.8. Much, however, remains to be done.

The Committee limits itself to a rapid enumeration of the chief of the measures that should be taken on board ship.

First, a ship should be considered as a habitation, and as—eventually—a receptacle of morbific germs. Naval hygiesis begins at the stocks. It is necessary to consider what improvements may be introduced in the seasoning of the wood, and the preparation of the timbers and planks to be used in building; the tightness of the hull, the size of the hatches, the positions of the bulkheads and the ports, with all that is connected with the circulation and renewal of the air, the cleanness of the hold and the bilge, the victualling, the preparation and preservation of provisions, the material and make of the clothing of the crew, &c. &c. Governments and Maritime powers should give prizes and honors for inventions that promote the salubrity of ships and the health of crews and passengers.

When the ship is ready to sail its condition should be carefully ascertained, and especially if proceeding on a long voyage. The Master should be required to remedy any evils pointed out by authority. The insalubrity of many old ships is notorious, and the Official Agent should have power to prevent the sailing of such as

are in a condition that renders them likely to produce fever, dysentery, or other diseases.

The condition of the cargo also deserves attention. shipping of damp substances, or such as have been recently w with the rain, should be forbidden. Large timber, or places, taken out of rivers, or marshes, should be washed and dried as as possible before being taken on board. Goods and raw rial, especially organic substances, if they are soiled, damage decomposed, should not be allowed to be shipped.

Precaution is required as regards the nature of 'and the mode of stowage. And much attention sho given to the clothing of the sailors, and the condition of their berths and hammocks.

Before the departure of the ship enquiry should be made as to the quantity and quality of the provisions and beverages, and the drinking water should be attended to, especially when Cholera is prevalent. Always, but particularly then, the shipping of unddy or impure water should be prevented. It would be necessary, even in ordinary times, to forbid watering at certain streams, rivers, or springs, of doubtful salubrity.

The number of the sailors should be in proportion to the tonnage and to the length of the voyage. The health of the crew should be ascertained by strict examination by a medical man. It is also of great importance that the health of the passengers, so far as possible, should be ascertained, and that their number should be in proportion to the tonnage, the capacity of the cabins, the number of beds, mattresses, blankets, the length of the voyage, &c.

Crowding is the great evil in ships, especially in times of Cholera. The Committee has no hesitation in recommending that there should be rules to fix the maximum numbers of passengers to be carried. The cupidity of Transport Companies and Masters of Merchantmen should be resolutely checked, as they are always eager to take on board passengers, and to crowd the cabins, and even the decks of their ships, contrary to the first principles of life and health.

The cubage of air is often insufficient in ships, especially at night; and ventilation is not always perfect. When to these two iical causes of unwholesomeness are added the crowding, the diffing products of the respiration and the perspiration of so may men, the evaporation from wet clothes, the effluxia from hal-mocks and cots, from soiled linen, from the sick, &c., it is not difficult to foresee the troublesome results. Such continued it is not of the auxiliary causes of every kind of ill.

The transport of living animals claims attention. Apart from tability of Cholera by them, a question which the Confersional framed from answering, it is necessary carefully to poisoning of the air by the over-crowding of cattle on board, and to spare those at the ports of debarkation from the revolting sight of the landing of a great number of animals in a state of asphyxia. The Committee calls the attention of the sanitary authorities to the necessity of having a physician, or a surgeon, on board regular passenger ships, or those whose crew is of a certain number. The presence of a medical man is always a benefit to those on board, and when it is viewed as a guarantee against the importation of Cholera, as a source of information, and, above all, as mitigating the quarantine, it is a question that deserves mature consideration.

The sanitary service on board merchant ships should be regulated by the Government of the country.

All ships should be required to be provided with a medicine chest containing the common medicines and the most necessary surgical apparatus. The sanitary authority should make out the catalogue of medicines, and prepare a Manual of Medical Instructions for guidance, and it should be obligatory to have these and an abundant supply of disinfectants on board every ship before its departure.

All or most of these measures are well known, and even obligatory, in many countries, and it is very desirable that they should be made obligatory in all.

On the voyage the sanitary arrangements are but the continuation of those that were applicable at departure.

Scrupulous cleanliness of the ship, the sailors' berths and passengers' cabins, cannot be too much urged. The hold to forms a ship into a floating marsh on the least neglect to main in a wholesome condition this troublesome part of the velocity. This wholesome condition may be best maintained by means methodical stowage, by the good preservation of the cargo stores, by constant ventilation, and by the frequent removal of water in the hold. It is necessary to pump out frequently bilge water, to prevent, as much as possible, the collection black mud that is deposited at the bottom of the hold, infect this part of the ship when ventilation and the addition of clean water is insufficient to render this perpetual source of unhealthiness inoffensive.

The insufficient airing, the difficult access for the sun's rays to the interior of the ship, and the resulting humidity, are evils that it is necessary to combat by constant ventilation, by well arranged openings of sufficient size, and by ventilation by mechanical means. The double action ventilator of M. Peyre deserves particular mention.

In fine weather the exposure of the clothing and bedding in the air and sunshine should not be neglected on any pretext. Personal cleanliness should be enforced among the sailors, and they should not be allowed to sleep in wet clothes.

In ships from a port infected with Cholera the least amount of Diarrhea, the least derangement of the digestive organs, should be particularly attended to. Those with suspicious symptoms should be kept separate, and disinfectants should be used.

On arrival the sanitary observances will embrace precautions connected with the condition of the persons on board and of the ship.

All ships before being allowed free communication should be visited, in order that their condition may be carefully investigated,

and that it may be known how the sanitary police has been attended to during the voyage.

In ordinary times a well kept ship need not be submitted to an fregulations, but in time of epidemic sickness the sanitary autiority of the port will have to decide if it be necessary to resort to mitary measures.

Fit should be noted that sanitary arrangements at departure prival are more particularly the office of the Administration, like for the voyage devolve on the Masters, or those emshould be should be compiled, and an abridgement of it should be prepared for coasting vessels.

A Statistical Return of the Merchant Marine of every country, with the numbers sick and the deaths during the year, would be an excellent means of knowing the real results of earnest sanitary practice and of noting its progress. What is now recommended by the Committee for adoption is nearly in accordance with what is in practice in Great Britain.

#### The Committee would advise --

F.CC

- 1st.—To have meetings, and to give prizes for discoveries or improvements, the immediate result of which should be some advance in the sanitary improvement of ships; and in the amelioration of the hygienic condition of the crews, or in the well-being of the passengers.
- 2nd.—To publish a Sanitary Manual for the use of the Merchant Marine of each country. The carrying out of the most important rules in the Manual should be obligatory.
- 3rd.—To encourage by prizes and rewards those who have distinguished themselves in the good management of their ships and their crews.

III.—Sanitary measures to lessen the chances of reception of the disease in ports.

ne

an

in-

Lie

To defile the pure water of rivers with filth, to cove clean ground of anchorages with excrement and transform basins of our ports into cloace, is always a kind of profanation act of barbarism, an outrage against health. It is too committed, to choose the basin of sea ports as the receptacle for a ordure of the town. A visit to one of those ports at low that the approach of a gale, or during a fog, will convince, be offensive emanations from the enormous bed of slime and, how pernicious it must be to those who respire evident that the hotter the climate the more deleters, the influence.

We know that ships naturally defile the waters of the basin with ashes, dejections and other filth, and that it becomes necessary to clear the basin at intervals by dredging. But it is deplorable to see added to this evil that which comes from the drains and latrines of the town. Arrivals from an infected place find in those ports a soil eminently propitious to the development of morbific germs, and it is not astonishing that Cholera should be so quickly transmitted in sea coast towns, and that it should there propagate itself so destructively.

The business of great ports requires workmen for the repairing of vessels and for making cordage and sails, and men to lade and discharge the ships and earry loads; these, and the fishermen and the invalid or unemployed seamen, live naturally as near as possible to the port, and make a kind of marine quarter close to the town. This quarter is far from fulfilling sanitary requirements. Liquor shops, filthy taverns, offensive apartments, vice and indigence, have a prominent place; this population is in constant communication with the ships in the harbour, and it is in it that almost always the first cases of Cholera appear. Isolation would be the best safeguard for the town, but the difficulties of such a measure are generally very great, almost insurmountable. It is, therefore, a matter of urgency for self-defence to employ a strict sanitary police. In England and in Holland there are asylums for sailors, called Sailor's

Homes, which, the Committee thinks, deserve to be imitated in all great ports.

The Committe concludes as follows:—

The sanitary conservation of ports, with prohibition against the sew 's of the town being made to discharge into them, periodic dredge indixed a good interior sanitary police, are measures of highest inference for preservation from transmissible diseases in general, form Cholera in particular.

sanitary conservation of the quarters close to sea ports, and sanitary police in them, are also very important mea-

IV.—Sanitary measures to lessen the predisposition of places to the reception of Cholera.

This might include the whole of hygiesis, but the Committee limits itself to the consideration of the three most important points —air, water, and earth.

The air—It may be vitiated from its insufficiency for the number of persons who breathe it. This is the case in the deleterious over-crowding of the houses of the indigent. If Commissions and Associations, like those in Paris and London, that interest themselves in the improvement of the dwellings of the indigent classes, were instituted in every town, they would render very great service to the public health.

In many great cities in Europe special houses are being beneficently constructed for workmen.

Stagnation of the air is also one of the chief causes of its vitiation. The same cubage of air might, without inconvenience, serve for a greater number of individuals if it were continually renewed. Hence the importance of an abundant ventilation, as well for dwellings as for a whole town, because streets too narrow and crooked, or courts too small and enclosed with high houses, extend to a whole population the hurtful influence experienced by individuals in ill ventilated apartments. This influence is manifested especially

during Cholera, of which the air is the chief vehicle, because the air when slowly and insufficiently renewed, can communicate the disease to many more persons than it could if continually agit all by the wind.

A third source of deterioration of the air is the direct mir ting with it of deleterious gases, and, above all, of those resulting the decomposition of organic matters.

Water—What is important to show is the influence, pure water as a predisposing cause, and of water contaminate the Choleraic germ as a direct cause of the devel the propagation of Cholera, if this influence is not already generally admitted. The Committee relates examples in proof of this proposition taken from reported experience in England.

Water may be contaminated by infiltration through the soil into wells and cisterns, or by the direct introduction of organic matters, as in the case of rivers. The indications are to keep all reservoirs of drinking water at a distance from privies, stables. &c., to prevent the waters of brooks or rivers which supply towns from being defiled.

When, from constraint, impure water must be used, it should be first purified by boiling and filtering through charcoal, or by other means.

Earth—The soil of most towns is but a vast receptacle of excrement of all kinds to a degree of which few have an adequate idea, and the continual decomposition of those matters contaminates the air and water. To hinder the soil being rendered impure will, therefore, be one of the chief points in the sanitary conservation of towns.

Pettenkofer has calculated that the excrements of a hundred thousand inhabitants of a town annually impregnate the soil with an amount of putrescible matter equal to what would result from the decomposition of fifty thousand corpses interred every year in the same place, that is to say, around the houses.

It is easy to deduce from this that all excromentitious matter man and beast should be immediately removed to a distance from pitted places. In small villages and in certain quarters of a tarl unprovided with public latrines, the excrements are deposited recetly on the ground. In certain great cities, which might be expected to be under Police rule, open drains and absorbent pits to the the little advance that has been made in sanitary administration.

most towns the systems of latrines adopted are cess-pits, moveable vessels.

ingly great when they are are not built with cement, and even those that are cemented are not altogether impermeable. Hirsch relates that six months after the construction of a well cemented cess-pit, putrid organic matter was found in a well ten feet distant in such quantity as to prevent the water being longer used.

The drainage and water-closets, such as are used in England, may cause evils by their discharge into harbours, or into rivers. There is the additional danger that a great number of privies establish a direct communication between the sewer and the inhabited apartments of different houses. The dejections of one person with Cholera thrown into the sewer would suffice to poison many houses by the gas rising through the water-closet, and carrying with it the Choleraic principle into the apartment. Dwelling rooms, and especially bed-rooms, should be beyond all contamination from water-closets communicating with a common sewer.

The Committee does not enter into an appreciation, in all its details, of the improvement in drainage carried out in some towns in Scotland, and projected for London, which tends, on one hand, to preserve the rivers from contamination, and, on the other, to utilise the excrementitious matters in fertilising the fields. The cost is enormous, while local circumstances, such as the situation of a town in a hollow, insufficiency of water, great cold in winter, may render it impossible, and a certain impregnation of the soil by the excrementitious matters cannot be avoided.

The moveable vessels (with or without the separation of liquids and the immediate deodorization of the contents) are coming into more extensive use in many towns in France, Belgiv Germany and England. This system conjoins the best san conditions at little cost, and without any loss of fertilising mover for the fields. As this system requires the removal of the externa more or less immediately, its success depends on a well regreted system of removal and the choice of a place of deposit outside town. The Committee recommends that a manufactory of masshould be annexed to the place of deposit.

Sometimes, in order to repress an epidemic of Ch beginning, a general emptying of latrines and a clearing are resorted to, although this rather favors the propagation of the disease. In time of epidemic sickness it is dangerous even to raise the pavement, or in any other way to break up the ground in a town.

A system of gutters, well lined and cemented, should carry off the rain waters, so that they may not sink into the ground, and by a system of subsoil drainage the ground should be dried.

It is necessary to place the cemeteries at some distance beyond the suburbs of towns. The graves should not be less than six feet deep.

In times of Cholera it would be well to remove the corpse from the house as soon as possible, and it should be interred within twenty-four hours after death; it should not be washed, and it should be put into a well pitched coffin with the body and bed linen, but without any other clothes, and covered with quick line before closing the coffin; this also, when laid in the grave, should be covered with line. The removal of corpses to a place as yet free from Cholera should be interdicted.

The conclusion of the Committee is-

The sanitary conservancy of towns is an efficacious means of opposing the reception of Cholera and of lessening its ravages.

This conservancy should be based chiefly on a combination of measures tending to maintain the purity of the air, to supply the ans with abundance of wholesome water, and to hinder the contration of the ground with organic matters.

The immediate disinfection and the removal of excrementitious med rs are sanitary measures of the highest importance, especially res of Cholera.

".—Sanitary measures to check, as much as possible, the pro-

failed, and an invasion of the disease has already taken place, it yet remains to endeavour in the first place to lessen the number of victims, and in the next to render the attacks less fatal.

In following the first of those indications there should be house visitation, in order to watch over the salubrity of dwellings and the health of the individual occupants. The fave able results in London, Dumfries, Glasgow, Munich, where this was carried out, are alluded to by the Committee. The adoption of the system is strongly recommended as preventive, but, like all other measures, it should be opportune, complete and conscientious. Copies of popular instructions, containing precepts regarding the prevention, and the first cares to the sick in cases of attack, should be distributed profusely and gratuitously.

The depressing effect of fear is known, and it is well to raise the spirits of the people by all possible means. A question has been raised as to whether in an epidemic visitation it is preferable to conceal the danger, to understate the real numbers of attacks and deaths, or freely to confess the imminence, or the extent, whichever it may be, of the ravages of the disease. The Committee declares for complete veracity. This prevents the abandonment of precautions on the part of individuals, and it prevents also the exaggeration to which the public is but too much inclined. The contrary system most often produces only an effect diametrically opposite to what was intended.

If the general preventive house visitation has been omitted, immediate visits should be paid, at least, to houses attacked. It is then that medical care, and isolation and disinfection, can be most successful.

There should also be hospital aid. Every large town should have a permanent hospital for epidemic diseases. This hose tal should be outside the town, and should receive the first attaby any epidemic, whom, at present, it is too often necessar take into the ordinary hospitals before there has been time clear them of their sick. For those who cannot bear to be to the hospital outside, it may be necessary to have porary hospitals in the town, in hired or other hou houses adjoining them should be vacated.

If ever taken into general hospitals, the sufferers with Cholera should be in separate wards. The conveyance of the sick should be in vehicles exclusively appropriated for the purpose, and they should be stationed at the chief crossways.

The common latrines in hospitals should be closed; special vessels should be used for the dejections. These should be disinfected at once and carried away twice a day in well closed receptacles, to be taken to a distance, buried in trenches and covered with quick lime. The soiled linen of the hospital should be immediately steeped in water containing some disinfectant. Straw beds are preferable to mattresses, and the straw should be burnt after it has been used for one sick person.

It is equally necessary to disinfect at once the linen and clothing brought with those admitted into hospital. If the resources are abundant it would be preferable to burn all the effects of the sick: this will be applicable at least to the clothing of the deceased.

Nurses should be chosen, if possible, from among those who have already suffered from Cholera, and they should be in sufficient numbers to be able to afford them frequent reliefs, and give them hours for repose, which they should pass out of the hospital. The strictest cleanliness should be enforced among them.

The conclusion of the Committee is, that the judicious organisation of public assistance, general house visitation for prevena, or, in default of it, medical visits and immediate succour to a attacked, the publication of popular instructions, the encourant ent that arises from confidence in the promptitude and extent of succour, and the publication of the true state of the epidemic, the vening of special hospitals and of houses of temporary refuge alter the families of the sick poor, are sanitary and administration of the true state of the propagation of the measures very efficacious for impeding the propagation of the ra, and for lessening its ravages in places invaded by it.

emporary interruption of all communication with the ace, or persons attacked by Cholera is the preventive measure that is the most sure, most simple, and the first suggested by the instinct of self-preservation. But it is not easy to carry it out. It may be applied to an island, a peninsula of small extent, to a restricted locality, to a quarter, or to a particular house, but it becomes impracticable when it comes to be generalized. The Committee, however, recommends it in all cases where it can be effected.

Dissemination, in the acceptation of a dispersion of seeds or germs of Cholera, by great moving assemblages, which has already been considered, is an evil for those places yet free from the disease; but as regards the assemblage or concourse attacked, or threatened with attack, a scattering or segregation of the individuals is an important means of prevention. The moving assemblage must derive advantage from well directed change of place which betters their sanitary condition, and from the methodical segregation which diminishes, besides, the chances of transmission.

The change of place and scattering appear to have had very favorable results in times of epidemic sickness on the sanitary condition of troops where it has been tried. In the Indian Military Stations are found the most remarkable instances of this.\*

The Committee records the following:—

Temporary interruption of communication with infected places, provided it is absolute, is the most sure preventive of the transmission of Cholera.

The opportune change of place, and the methodical segregation of moving assemblages (caravans, bodies of troops, &c.) are very efficacious measures to prevent the breaking out of Choliamong them, as well as to check its extension and to mitigativiolence.

Opportune emigration and well regulated separation ay give favorable results in fixed masses (public Establishments,)

VI.—Sanitary measures to prevent and extinguish CV at its centres of infection by destroying in the in contaminated substances, the germs of the

The infecting principle of Cholera is as little known as the rest of the specific germs, but experience having taught that the air is its chief vehicle, that it acts only at short distances from its centres of emission, and that it often adheres to certain bodies, we may try to destroy, to weaken it, to drive it away by various means.

We do not always know very exactly what takes place during our disinfecting processes, but we obtain effects which lead us to believe that we have destroyed the Choleraic miasm, or neutralized its deleterious action.

A special treatise on disinfectants by M. Mühlig, one of the Committee, is appended to its report.

It is noted by the Committee that immediate disinfection in time of Cholera is of supreme importance.

Experience teaches that it is possible to extinguish Cholera, provided its centres are yet few, and that their complete isolation comes in aid of disinfection. In applying the disinfectants it should be to the dejections of the sufferer, the linen, &c., then to the apartment he inhabited with all it contains, and lastly to the house.

The Committee admits that disinfection applied to Cholera in a rational method and with perseverance is a powerful auxiliary:—

- 1.—To diminish in a place threatened with Cholera its predisposition to receive it.
- 2.—To destroy the germ of the disease imported into a locality.
- 3.—To limit in certain favorable circumstances the extension of the epidemic.

# ABSTRACT OF THE REPORT

ON THE

# QUARANTINE MEASURES APPLICABLE TO ARRIVALS WITH CHOLLE

The Committee was composed of His Excellency Salih Effendi (President), M. Stenersen (Vice President), M. M. Le Comte de Noidans, de Soveral, Drs. Bartoletti, (Reporter), Dickson, Baron Hübsch (Secretary), Maccas, Pelikan, Salvatori and Sawas.

The Report was dated 15th September 1866.

This Report treats of the subject of the second section of preventive measures to be adopted against the introduction of Cholera into Europe. The Committee states that it has been guided by the conclusion of the General Report, which had already been accepted by the Conference, and, while adoping the questions of the scheme which was approved at the thirteenth meeting, had, where it appeared to be necessary, made some additions to them, but, as it believes, in conformity with the views of the Conference. The Committee divides its work into five parts or chapters, in which it treats successively of the questions of restrictive measures in general; of sanitary cordons and isolation; of quarantine establishments and lazarets; of the regulations applicable to arrivals with Cholera, and of disinfection; and lastly, of the bill of health and the verbal declaration.

The Conference adopted this Report of the Committee, and the conclusions are, therefore, to be considered those of the Conference.

#### CHAPTER I.

#### GENERAL CONSIDERATIONS ON RESTRICTIVE MEASURES.

I.—What does experience teach regarding the systems of quarantine hitherto in force? Can more success be expected from quarantine established on other bases? What are the fundamental principles resulting from experience which should be our guide in this question?

t is not long since opinions were divided regarding the trans-. Cholera. The most general opinion was that Cholera elf by the air to great distances. On the other hand a large section of scientific men held the opposite, that it was communicated by man, but sought in vain to gain for it the ascendancy, because imbued, for the most part, with the doctrine of absolute contagion, they endeavoured to revive the obsolete measures that were formerly used against the plague. Both parties were evidently in fault, but experience was still insufficient, and they made mutual concessions, which resulted in the International Sanitary Convention of 1852, under which, in reality, neither a very exact quarantine was enforced, nor was a pure and simple free intercourse allowed. No light could be thrown by the working of such a system on a question so obscure and so difficult to selve. For what could be expected from a quarantine of three to five days, including most commonly the voyage, and not taking into account either the duration of the incubation, or the premonitory Diarrhoea, or infected goods, or linen soiled by the dejections? Also as regards the lazarets, those establishments, situated on badly chosen ground, adjoining towns, built like barracks or prisons, often crowded and with confined and unwholesome air, were in general more fitted to communicate Cholera to the neighbouring populations than to preserve them from its attacks. As examples, the lazarets of Beyroot, the Dardanelles, Ancona, and many others, may be cited.

It is true that, since the first appearance of Cholera in 1830, strict quarantines have been established—organised sanitary cordons on a vast scale—in Russia, in Prussia, and elsewhere in Central Europe, to avert the epidemic, but those measures, being under-

taken in the midst of dense populations and with inexact information about the disease, ended only, from the miscalculations, in negative results. It is even probable that the cordons contributed to the dissemination of the evil against which they were emplo Sweden, in 1847 and 1850, made a more sustained attempt the other States of the north of Europe to protect itself; but here iso Cholera passed the barriers that had been raised at the pril of great sacrifices. Often the separation and isolation were no recourse to until the disease had already been introduced, the country, or its precursors and the Diarrhœa had al. May it not be added that the men forming the were the first attacked, and, as often since then has served as the vehicle for the disease? Was it not the military guard outside the Dardanelles lazaret communicated Cholera to the town population?

The Committee concludes that—examples taken from the experience of that first period of quarantines are not conclusive.

Among the trials that were made there were some that were successful. Such was that at Mecklenburg in 1859. Greece, by a complete sequestration of all arrivals with Cholera on inhabited islands, escaped all the epidemics which have ravaged Europe, excepting in 1854, when the Piraus was occupied by foreign troops. In 1865 Cholera was twelve times imported in two months into the lazarets of Delos and Skiathos, and it was there extinguished. Candia had like success twice in one month, by a strict sequestration of the arrivals on two islets. Volo twice preserved itself by enforcing quarantine on a desert island. New York gives the striking proof of three importations rendered abortive by intelligent measures of sequestration. Examples might be multiplied, but they will be found in the historic sketch of the epidemic which was presented to the Conference by another of its Committees.

The Committee is of opinion that it is incontestable that quarantine, established on rational bases and inconformity with the progress of science, may serve as an efficacious barrier against the invasion of Cholcra.

The bases on which to rest a new system of prevention should be sought in the experience derived from various epidemics, and re particularly that of 1865, and in the conclusions adopted by Conference on the question of transmissibility. The Conference has said that Cholera is transmitted by the sick, by choleraic lejections, by contaminated goods, by soiled linen—its principle vehicle being the ambient air. The duration of incubation n exceeds a few days, seven at most, and Choleraic Diarrhæa very short duration.

the Committee agrees that, if quarantine were to be instituterrors of the past, making permanent cordons and
the case of the middle age which systematically separated
the East from the West, it would seriously affect the interests of
the whole world. But what is proposed is based on facts determined by science, and excludes that blind routine now for ever
condemned.

The measures to be adopted may be divided into two series-First, to find the means of preventing the importation of Cholera from the Indian side; to isolate it in the Hijaz, when it is developed there in consequence of the pilgrimages; to take special measures when it appears in Egypt; to interdict emigration from contaminated places; to break off communication between infected places and the surrounding country; in short, to apply the restrictive measures, as near as possible, to the primary and initiatory sources of the epidemic-Secondly, to establish entirely isolated lazarets; to fix the duration of the quarantine in accordance. with that of the incubation of the disease, and without losing sight of the premonitory Diarrhea; to subject the ships, the clothing and linen, to disinfection by washing, airing, and the reputedly most efficacious chemical processes; excepting in exceptional cases to allow merchandise to pass without purification; in ships in which there is carried out a series of measures applicable to the time of their departure and during the voyage, to allow the time occupied in the voyage to count towards shortening the quarantine after arrival, so far as may be compatible with the public safety. other terms the bases of the new system of prevention, in the

opinion of the Committee, should consist of, first, combating the germs of the disease in its primary sources before they disseminate and propagate themselves beyond; second, establishing quarantinaccordance with the principles now admitted regarding the transibility of Cholera and its mode of propagation.

#### CHAPTER II.

SANITARY CORDONS, ISOLATION, INTERRUPTION AND RESORT OF COMMUNICATION.

I.—What is the amount of utility of sanitary cordons? In what circumstances are they applicable, and how are they to be applied?

The cordon, formed of a line of troops, or of detachments posted at intervals, has for its object to isolate a country and to intercept its communications, in order to hinder an epidemic from being propagated. Experience has proved that the utility of cordons depends on their extent and the manner of placing them. The trial in 1831 failed because it was on a great scale in a populous country; and from its being too near the sources, for the soldiers to be free from exposure to the infection, they were attacked, and became the means of disseminating the disease. Under such circumstances the cordon would be more dangerous than useful.

It would be otherwise if the cordon were formed under the opposite conditions; if the country were thinly peopled; if the ground were favorable to its being easily watched; if the men forming the cordon, placed at a convenient distance from the source of the disease, were themselves sheltered from infection; if the sanitary authority were to attach to the premonitory Diarrhæa the importance due to it; in a word, if the rules as to isolation were so scruplously observed as to maintain a vacant space round the choleraic centre.

The Committee cites instances of the efficacy of cordons from the records of the disease in Russia, Palestine, and Arabia. The inmittee concludes that sanitary cordons in the middle of rous and dense populations are of uncertain effect, and often are fangerous; on the contrary, in limited localities, or countries that are thinly peopled, as in some countries of Asia, cordons are fit to be very useful against the propagation of Cholera.

II.—What are the teachings of experience on the subject of the isolation of the sources or centres of Cholera?

If the question of isolation is taken in its general aspect, it is intimately connected with that of cordons, because when cordons are useful, and it is possible to establish them, there is surety of profitably isolating a centre of Cholera. Isolation of a source or centre is practicable and useful in certain cases, difficult in others. In the East, where the villages are relatively far apart, where the intercouse between one town and another is not so frequent as it is in Central Europe, and where the people are of sedentary habits. isolation is more easily carried out than in countries where the rapidity and the multiplicity of the communications, the commercial activity and the interchange of interests, keep multitudes of people in constant movement. Infractions in this latter case would be inevitable, and the end would not be attained. Nevertheless, the Committee is of opinion that isolation, wherever it can be employed in the first cases that mark the beginning of an epidemic, is a measure of prudence, which no country should neglect to take for its safety.

The Committee concludes also that, first, the isolation of a place attacked with Cholera is more practicable and useful in proportion as the population of the country is more thin and the sequestration takes place more near the beginning of an epidemic; second, the isolation of the initiatory sources is the chief measure of prevention against invasions of Cholera,

# IV.—In what cases is the interruption of communications with infected places applicable?

In carrying out this, the epidemic would exhaust itself or spot, without propagating itself beyond it, as in caravans it de desert. This heroic measure is not always applicable. It is put rarely that it can be employed, and the Committee does not fink it possible to stifle Cholera in its source, unless it be in a cit scribed and primary source, such as a house, a public establishma village, or even a town or a canton. This measure would be applicable to a sea port with a restricted commerce, and only limited maritime intercourse with the surrounding

The conclusions are, that interruption of intercourse is the best means of isolating the choleraic sources, and consequently there is reason to employ it always when circumstances favor its being rigorously carried out; but that measure, which is applicable only to circumscribed points, becomes impracticable and inefficacious when the epidemic has propagated itself to a great extent.

There were two of the Committee who voted against this conclusion.

V.—Is it not advantageous under all circumstances to restrain emigration from infected places? By what means can this be attained?

Restriction of communication is often applicable, and more practicable than absolute interdiction. There is reason to restrain embarkation at the sea ports as much as possible, and to subject those that are to go on board to a series of preliminary precautions. But the restriction on embarkation should have principal reference to emigration. Emigration from a centre of the disease to a great number of other places has spread the germs of Cholera over all the European continent. Thirty-five thousand persons left Alexandria; forty thousand, out of a population of a hundred and seven thousand, emigrated from Valentia; Palma had its population reduced from fifty thousand to ten thousand; out of thirty-seven

thousand, fifteen thousand emigrated from Carthagena; Barcelona, counting a hundred and ninety thousand inhabitants, was reduced half that number by emigration.

The Committee proposes, first, to restrain emigration within the foundaries of the infected town; second, to fix by regulation the number of persons which each ship may take on board in proportion capacity; third, to subject individuals and their personal effects eliminary precautions, such as medical visitation, purification thes and goods, &c.

Committee thinks this measure is a very important guaanly as regards the ports of debarkation, but also as respects the passengers, whose life would perhaps be more endangered on board crowded vessels leaving a centre of Cholcra than in the infected town they are leaving.

#### CHAPTER III.

#### LAZARETS.

V1.—What are the conditions that experience has shown to be necessary to make these establishments in all respects answer their object—as to position at a distance from inhabited places, facility of access and of victualling, salubrity of site, kind of building, interior arrangement, classification of the parties in quarantine, &c.?—as to lazarets of observation, temporary lazarets, floating lazarets, international lazarets?

During last epidemic the greater part of the lazarets failed in their end in allowing Cholera to reach the towns in their proximity. Their defects are numerous; there are faults of position, construction, arrangement, interior economy, and many others, which it is necessary to take into account in the quarantine system to be adopted for Cholera.

On the other hand, lazarets improvised under tents and in barracks, but with complete isolation, have shown the best results.

The contrast is striking between the lazarets of Greece, Candia, Volo, on islands, and the lazarets of Odessa, Ancona, the Dadanelles, &c., near towns.

It is necessary to give preference to desert islands, and see ly to places far removed from centres of population, and situate so as to ensure absolute isolation.

There are many other conditions to fulfil in chosing a for a lazaret—

1st.—As to the nature of the soil. The best is the and granitic; while a porous and alluvial soil, by its proise is susceptible of becoming, according to the theory now admitted, a receptacle of morbific germs.

2nd.—It is advisable to avoid marshy soils, sources of intermittent fever, and apt, under certain circumstances, to give activity to the Choleraic principle.

3rd.—The site should be provided with a sufficiency of good water.

4th.—One of the conditions of the highest importance is that there be a good anchorage, sufficiently large to shelter in safety a great number of ships. The facility of access at all times would be the more necessary were the establishment on an island, because the revictualling should be regular, and undertaken in such a way that those in quarantine would want for nothing.

## VII. The plan and arrangement of lazarets.

The present lazarets are usually a square court, a kind of cloister, surrounded with buildings communicating more or less with one another, and containing the dwellings and the warehouses for the deposit of merchandise and for its disinfection; an infirmary (but this is not always found), a parlour, and some apartments pertaining to the administration.

The capacity of these establishments is generally insufficient in times of epidemic Cholera. All these buildings should be abandoned.

In 1865 quarantine was performed in the lazarets under tents ad in huts. The huts have given good results, and would be ferable to masonry buildings were it not that they want solidity flurability. The Committee proposes that, with some exception, masonry should be adopted for the buildings.

A large place being given, if possible on an island, or, in eult of this, in the country and several miles from any habitan. There should be built apartments for those in quarantine, an ital for the sufferers under Cholera, wash-houses, stables and ure for animals, a hotel, apartments for the administration of the accessory buildings. There should be besides places loss landing and storing merchandise and provisions.

1st.—The habitations of those in quarantine should consist of many ranges of small ground floor houses, divided internally into four apartments, with windows on the four faces, and capable of lodging twenty persons, perhaps five in an apartment. Every cottage should be separated from the rest by a distance of (20 metres) about sixty-five feet, and every range, consisting of ten cottages, by an interval of (100 metres) three hundred and twenty-eight feet. This system is in use in Greece, and was in operation during the last epidemic.

2nd.—The hospital should be of several separate small houses, constructed on the same plan as the dwelling apartments. It should be partitioned into two apartments, of which the one in front would serve for Cholera sufferers, the other for those affected with simple Diarrhæa. Each house, well exposed and well aired, should contain five to ten beds. A dispensary for necessary medicines should be attached to the hospital; also a kitchen for the convalescents. There should also be a dwelling reserved for the physician and the attendants on the sick.

3rd.—There should be two wash-houses in every lazaret—one for the hospital, the other for the inmates of the other dwellings. They ought to be distant from one another and from other buildings. Particular care should be taken to prevent their waste waters infiltrating the ground.

- 4th.—A store of bedding and furniture should be at the disposal of the Establishment, and the Administration should watch over the cleanness of the articles, lest they should become a mer of transmitting the disease.
- 5th.—The Committee advises that there should be three classes of apartments—the first for persons in easy circumstalles, the second for the middle class, the third for those less accust to conveniences. The prices of these lodgings should differ accordingly, and should be fixed by regulation.
- 6th—The hotel of the lazaret should be isolated a with necessary provisions, the prices of which should be not nand be fixed by competent authority. Those conducting the hotel should in no case be in communication with those performing quarantine.
- 7th.—The warehouses for merchandise not subject to purification should be outside the lazaret enclosure, and near the landing place, in order to facilitate the unlading and beling of the ships. They should also be of an extent proportioned to probable requirements. The warehouses for merchandise, subject to purification, should also be proportioned to probable requirements, but relatively less extensive than the former, because the articles liable to disinfection are comparatively few. The situation of these latter warehouses should be different from that of the former, but always outside the lazaret enclosure, and at a convenient distance from the shipping, to facilitate operations.
- 8th.—A lazaret having of necessity to be watched by an armed force of greater or less strength, in order to maintain order and security, especially if on an island, or in a distant solitary place, it is necessary to provide accommodation for the troops. There should, therefore, be a guard placed at a distance of at least (200 metres) about two hundred and twenty yards from the quarantine establishment, because it is of importance to remove the troops, as much as possible, from risk of attacks of the disease.

9th.—There should be two landing places for every lazaret, one for the merchandise and persons in sequestration, the other for that are allowed free commerce. There must be an Office of th, where those having the direction of all the establishment who eside. Its situation should be near the port.

10th.—The question as to continuing the custom of having parture attached to lazarets and allowing visits to those in quarar ene was discussed by the Committee. The majority is of ion that it is prudent to suppress the parlours and forbid visits.

To prohibition was not to extend, however, to those who, for preasons, might wish to enter the lazaret and remain whereasts the quarantine of those with whom they have thus come into communication should last, and submit to all the consequences of the position in which they would thus place themselves.

11th.—The Committee is of opinion that there is reason for subjecting living animals to purification, and therefore every lazaret should be provided with a special enclosure, with stables and sheds.

12th.—The question of latrines had much attention. It is the opinion of the Committee that drains and common latrines should be suppressed in all lazarets for Cholera, and that there should be used the most perfect pattern of moveable vessels, charged before hand with disinfectants. The excrementitious matters should be at once carried away, thrown into trenches dug in the earth, and covered with quick-lime and powder of vegetable charcoal. Two members of the Committee would have wished that every individual should have a separate vessel so placed that the medical man at his daily visit might inspect the alvine dejections to detect the beginning of Diarrhæa. But this, although practicable in an hospital, appeared to the majority to be too complicated for a lazaret containing hundreds of persons.

13th.—The arrangement at intervals of the blocks of apartments allows of the easy islolation of a group among which Cholera may appear; it allows also of the complete separation in classes, according to the degree of suspicion and the date of arrival. This classification is of the highest importance, and, unless it were strictly

observed, a healthy individual would be liable to contract the disease up to the last moment before his liberation. The separation in classes is necessary both for the security of those perfe ing quarantine and to hinder Cholera passing the boundary c lazaret, and it should be maintained with the greatest strict The distances between the different buildings in the lazaret will depend on the extent of ground at disposal, but it should be a ale that the hospital be at least (200 metres) about two hundred md twenty yards, or a furlong distant from the dwelling apartme that the houses of the establishment be yet farther from be hospital and the dwellings of those performing quarr that the hotel, the warehouses for merchandise, and th animals, be outside the lazaret enclosure, at even greater distances It is of importance to keep in view that isolation from each other. would not be complete unless there were an interval of from a furlong to a furlong and a half round the different houses occupied by those suffering from Cholera, by those ill with simple Diarrhea, by those under quarantine who are in good health, and by the persons having the administration of the establishment.

14th.—The question as to the persons composing the establishment for the service of a lazaret is of the greatest importance. The Committee does not enter into the details of the subject. It recommends that the direction of quarantine establishments should be committed to instructed physicians, understanding the value of the measures applicable to Cholera. It proposes besides that there should be at least three physicians in every lazaret, of whom one should be attached to the hospital, another should have the care of all others in quarantine, each attached to his special department, and neither having any communication with those beyond it. The third should, under the orders of the Medical Director, be charged with the duties of the port, and with the admission and discharge of those subject to quarantine.

VIII.—The number of Lazarets.

(1st). Lazarets of observation.—The number of lazarets should be as small as possible, but should always have reference

to the extent of the sea coast of the State. The experience of Russia, Turkey and Greece, shows that it is of incontestable utility have three classes of quarantine establishments—a limited the per for strict quarantine, a greater number for quarantine of observation, and numerous posts for the mere control of arrivals and for inspecting bills of health.

The lazarets of observation should be specially devoted to the ling of those arrivals with clean bills which the sanitary has reason to suspect, whether it be because the place it the ship has come does not afford all the guarantees of sectority that are desirable, or that there are particular circumstances connected with the ship, or because there has been communication with intermediate suspected places. There may be lazarets of this kind, without inconvenience, in all much frequented ports, provided that the quarantine of observation does not involve, unless in exceptional cases, the debarkation of the voyagers or merchandise.

- or by land, and are for the preservation from Cholera of a locality which has not a permanent lazaret, and the trial of them which has been made in the East, during the last epidemic, gives evident proof of their efficacy. It is the system of encampments that is alluded to, a system which is fitted to be of great use, as it is perhaps the only one that is admissible in certain countries of Asia, on account of the climate and the mode of life among the people. The Committee believes it, above all, applicable to great masses of persons performing quarantine, and to pilgrimages.
- (3rd). Floating Lazarets.—These might be made use of in cases of urgency. It was by this means that at New York the passengers from ships that had Cholera on board were, in the first instance, sequestrated. The Commission cannot recommend the employment of floating lazarets, excepting in very exceptional and urgent circumstances.

# IX.—The question of international lazarets.

An international lazaret, in the widest acceptation, would be a mixed institution as regards the administrative established and the expenses, which would be borne conjointly by the Gornments taking part in it. All the advantages of such an institution, however real they may be, are counterbalanced by many inconveniences.

- (1st).—There would be as many different appreciation of cases that might arise, as there were representatives of the ernments interested in them, and hence misunderstant conflicts of opinion and authority.
- (2nd).—There would be great injury to commerce and navigation in forcing vessels to take a path the opposite often to that of their destination, to go to perform quarantine at a place more or less distant. For sailing ships, especially, such a deviation of path might have disastrous consequences.
- (3rd).—There would be a large accumulation of ships and persons, which might produce great centres of infection.
- (4th).—There would be infraction of the sovereign rights in the territory where such a mixed establishment was placed, which, it is presumed, no Government would allow in its possessions. The Commission, after weighing the advantages and disadvantages, abandons the proposal.

If a more restricted sense be attached to the international lazaret, the subject presents a more practical aspect. Such would be an establishment situated in a position tavorable to navigation, under the administration of the local Government, without any foreign interference, and in which the ships of two or more nations would be allowed to perform quarantine, in virtue of a special convention entered into by the Governments interested, the payment of fixed dues being made according to agreement between the contracting parties. This system is in force in the Baltic among the bordering States. Sweden has the establishment at Kanzoc, an islet in the Categat; manages it, pays the expenses, and remu-

nerates itself by a due which it takes from the vessels, and which is agreed to among Sweden, Russia, Prussia, Mecklenburg and Imark. The Committee thinks there is reason to recommend doption of this system to Governments that may judge it useful p adopt it. Drs. Maccas and Pelikan recorded their opinion that in certain cases the utility of international establishments, under the administration of the local authorities, but under the control of mixed councils, is incontestible.

#### CHAPTER IV.

RULES FOR QUARANTINE AND DISINFECTION.

As shown in Chapter II., experience is in favor of rigorously enforced restrictive measures against the importation of Asiatic Cholera. The Committee explains that it inverts the order in the scheme of the Conference, in order to simplify the study of the subjects. It divides them into two sections, the first of which treats of quarantine properly so called, of the difference between rigorous quarantine and the quarantine of observation, of the duration of quarantine under different circumstances, and its application to persons and to ships. In the second section it explains the system of disinfection applicable to ships, to articles supposed to be contaminated, to personal property, clothing, merchandise, living animals, &c.

X.—Quarantine. Are there grounds to admit of two kinds of quarantine, under the names of quarantine of observation und rigorous quarantine? In what does the difference consist?

The distinction was established by the old regulations, and it was maintained by the Sanitary Conference of Paris.

The quarantine of observation consists in keeping apart and under observation a ship, its crew and its passengers, for a period that does not usually exceed a few days, counted from the time when the guardians of health are put on board, but it may be prolonged by the sanitary authority. It does not entail the discharge of cargo, except there be in it decayed and corrupted substances.

It does not require disinfection, but only general hygienic measures. It is applicable to suspected ships, even if furnished with a clean bill of health; first, if there are doubts as to the health of the place of departure, in order to give time to clear up those down, or if there have been calls at intermediate ports, or doubtful inmunications at sea; secondly, on account of the particular circumstances of the ship, and of the health of the crew and passengers. The quarantine of observation may be performed in my port where there is a sanitary establishment. The passenger is remain on board or land at the lazaret, according to the specific cumstances of the case.

Rigorous quarantine is sequestration and isolation time, both for ships and persons, with disinfection of all that is capable of harbouring morbific germs. It necessarily implies the discharge of cargo at the lazaret. It is applicable, first, to ships from an infected place, with a foul bill for Cholera, with the exceptions to be afterwards mentioned; second, to ships that have had cases of Cholera on board during the voyage, although they have a clean bill. The quarantine begins for ships in ballast from the time the guardians of health go on board; for laden ships after the discharge of cargo; for persons from their entering the lazaret.

According to the Committee, the difference consists in the quarantine of observation being a time of probation, of simple watching, while rigorous quarantine consists in the debarkation at the lazaret with disinfection, and comprises all the measures applicable to an arrival with Cholera.

XI.—What ought to be the duration of the quaratine of persons coming from an infected place? From what time ought the quarantine to count?

It is the rigorous quarantine that is here under consideration. This question is essentially connected with that of the duration of incubation, regarding which there is far from being the agreement that is desirable. Another question connected with this one is that of the capability of the premonitory Diarrhea to transmit the disease.

The Conference has pronounced its conclusion on those points, and the Committee, basing its reasonings on that conclusion, proposes—

co Chinated place, be fixed, as a general rule, at ten complete days, and that this quarantine begin for persons from the time they enter the lazaret. That if during the quarantine, cases of Cholera or Choleraic Diarrhæa occur among them, the healthy persons, after separation from the sick, should begin again the quarantine of ten whole days.

This is agreed to by all, except Dr. Pelikan, who proposes deve of quarantine.

persons affected with Diarrhaa, and for isolating them from those who are well, just as is done with the sufferers under Cholera, and for not allowing to them free intercourse at the end of the regulated quarantine until after medical observation has proved the non-choleraic nature of the Diarrhaa.

Drs. Pelikan and Sawas thought that arrivals from an infected place suffering from Diarrhea should be detained until completely cured, unless in chronic cases, declared to be such by medical certificate from the place of departure.

XII.—In quarantine applicable to ships supposed to be contaminated is there not ground to make a distinction between those in which Cholera has manifested itself and those where the disease has not appeared? What measures would be applicable in the one and in the other case? Should disinfection always be imperative? In the instance where a crowded ship had a severe epidemic of Cholera on board, would there be ground for subjecting it to unusual precautions? What should those precautions be?

The principle is, that every ship arriving from a place infected with Cholera is subjected to rigorous quarantine. In this case after the examination on arrival the ship is sequestrated, the passengers are landed at the lazaret, as also the goods liable to purification, and the disinfection is immediately proceeded with.

Here is seen the difference that should be made between a ship arriving from an infected place and which during the voyage has had cases of Cholera on board, or cases of Choleric Diarrhæa, another ship the crew of which and the passengers have been satisfactory state of health, without having had any casualty ving room to suspicion of Cholera. The Committee thinks that in the second case the procedure should be much less severe than in the first, because there is less to fear. The sequestration and the duration of the quarantine, fixed at ten days, ought to be the sain both cases; it will besides be necessary in the second on use simple purification by airing, washing, &c.

In merchant ships with small crews and few or no passengers, and making long voyages that exceed fifteen or twenty days, the long voyage is a guarantee that should be taken into account towards lessening the duration of the quarantine.

## The Committee proposes—

First, to apply to ships supposed to be contaminated the rigorous quarantine, fixed at ten whole days duration, dating from Second, to allow a difference between ships on board of which Cholera, or Choleraic Diarrhea, has appeared, and ships which have had no signs of Cholera during the voyage. first instance all measures of rigor, isolation and disinfection, should be considered applicable; in the second the ships should be exempted from discharging cargo not liable to purification, and should be subjected only to general hygienic measures without disinfection properly so called. Third, to subject to exceptional precautions crowded ships, and those on board of which a severe epidemic of Cholera has appeared, precautions which should consist of a more complete isolation, disinfection by the most active agents, and even the prolongation and the doubling, according to the case, of the duration of the quarantine. Fourth, to reduce to five days the quarantine of ships that have had a voyage of fifteen or more days without any occurrence of Cholcra on the voyage.

XIII.—Is there not ground, in certain specified circumstances, for including the duration of the voyage of ships arriving, in the time fixed for the quarantine? If it is so, state the circumstances.

The Committee does not hesitate to recognize the right that shibs in which no choleraic sickness has appeared, have to be treated differently from those in the opposite condition, and thinks it can admit the principle that, under certain conditions, the duration of "rantine might count from the day of departure. The cond-I should comprise, first, the presence on board of a medical man "evi to the charge. Second, the use of a series of fitting the place of departure, during the voyage and at the place of arrival, those measures being that the crew and passengers about to embark be visited officially by a medical man, who should ascertain their state of health, and exclude those showing the least indication of a choleraic kind. (Chronic sufferers having a special medical certificate might embark.) That the persons embarked should have only such baggage as is strictly necessary, and their linen should be washed before embarkation. On the voyage there should be continued the measures of disinfection, airing and washing the ship, articles in use, and, above all, soiled linen. cal man on board should watch all those operations, should ascertain the state of health of those embarked, and note the cases of sickness that come under his observation in a register, which he should render on arrival to the sanitary authority. The Committee thinks account should be taken, under such circumstances, of the length of the voyage in fixing the duration of the quarantine, but it is divided in opinion as to the time for which it should Dr. Dickson maintains, in accordance with the admitted time count. of incubation, that after a voyage of ten days free intercourse might be allowed without danger to the health of the public. Drs. Maccas and Pelikan propose to reduce to seven days the quarantine of ships that arrive in a healthy condition after a passage of a week, and to five days that of those whose voyage has exceeded two weeks, but this quarantine should always be rigorous and its duration be counted by complete days. Some members of Committee think that, under the circumstances specified, and when there has

been no indication of Cholera during a voyage of nine days, free commerce should be allowed after twenty-four hours quaranting of observation. There was a long discussion, but unanimity countries not be arrived at.

The opinion of the majority is that ships with a foul bill with Cholera which shall have fulfilled the conditions specified in this article shall be able to reckon the days of the voyage as days of quarantine until they reach nine days. They shall perform at port of arrival a quarantine of observation, calculated so as to plete the regulated ten full days.

The Committee proposes the following scale:

After 24 hours voyage 9 days quarantine of observation.

11	2 davs	22	8 ,,	11
"	3,	21	7 ,,	,,
,,	4 ,,	17	6 ,,	٠,
"	5,,	"	5 .,	:,
"	6 ,,	••	4 .,	٠,
••	7 ,,	1,	3,	,,
<del>,</del> •	8	;;	2 ,,	٠,
	9	11	21 hours.	

For ships that have had a royage exceeding nine days the quarantine of observation should always be at least twenty-four hours.

XIV.—From the time of the arrival of a ship can the quarantine be performed on board? In what cases, within what limits, and how?

As regards the quarantine of observation, this has already been answered. But there are exceptional cases in which even rigorous quarantine is performed on board. This would be the case in ports where there is no lazaret, or where ships are detained by stress, as when damage does not allow of their reaching the lazaret port. Quarantine might be performed also in ships with foul bills, but in a satisfactory condition as to health, and with a very limited number of passengers. The Committee is of opinion

that the seclusion may be carried out in ships in the case of quarantine of observation, and sometimes in rigorous quarantine, through ree of circumstances; but in all cases the sanitary authority will care to avoid crowding, and will keep an attentive watch over realth of those in quarantine.

## XV .- Land Quarantine. - What ought its duration to be?

Arrivals by land are less likely to transport the germs of ra than those by sea, on account of the airing and isolation vellers, a circumstance which lessens the chances of the of the disease. The Committee believes that this difference between arrivals by sea and those by land authorizes a diminution of the quarantine in favor of the latter, unless when the epidemic is raging in the neighbourhood; and it proposes in consequence a quarantine of eight entire days for all arrivals by land, excepting in pilgrimages and movements of troops, for which the rule should be more severe. Nevertheless, it is understood that, if the arrivals by land have left a centre of the disease within a march of from one to three days, the quarantine should be for ten full days.

## XVI.—Disinfection.

It is applicable to contaminated ships, to clothing and articles in personal use, to certain specified goods, and to living animals.

## 1st.—The disinfection of ships.

The disinfection should begin by unlading, performed as much as possible by the ship's crew, unless the sanitary authority arranges otherwise in certain very serious cases, such, for example, as a violent epidemic on board, which would necessitate the landing of all the crew at the lazaret. The ship being anchored in an isolated position, the well is emptied, and the disinfection of the hold by fumigations of chlorine are proceeded with. The hatches are opened, and windsails and ventilators are placed to air the interior of the ship. Copious washing is performed, and oil paint-

ing, which completes the disinfection. In the case of a severe epidemic on board, all the measures for disinfection will be employed oftener, and with more perseverance than in less grave cases.

2nd.—The disinfection of linen, clothing and personal prof. by.

Those things will be landed at the lazaret with the persons to whom they belong. Before sending them to the wash-house, they will be immersed in water charged with chloride of lime, and will be left in it for some time. They will then be exposed in the oren air during all the remainder of the quarantine. The lineral clothing of sufferers from Cholera will be treated with all strictness, and will even be destroyed by fire, when it and the sanitary authority judges it to be necessary.

3rd.—The disinfection of susceptible goods.

The aptitude of goods to transmit Cholera is not yet demonstrated. That the transmission may be possible, especially through certain articles, such as rags and skins eminently apt to be impregnated with morbific germs, is less doubtful, but it appears certain that goods imported from India, whether by Suez or directly into Europe, have never transmitted Cholera.

Besides, the contamination of goods cannot take place but through their being soiled by the dejections of the sick. cannot be admitted that goods coming from manufactories can be soiled as linen and clothing which are used by the sick may be. -In consequence the Committee make two great divisions: one to comprise goods issued from factories and well packed in bales; the other to include rags and skins, leather and other animal substances, also goods not packed in bales, such as raw wool, and similar substances, which, coming from contaminated places, would be more or less exposed to contact with the passengers. Goods of the first class, which may be called not susceptible, will be landed at the lazaret, placed in a warehouse, and exposed to the air during the quarantine; they will then be delivered without being disin-Those of the second class, among which it is judged necessary to include made clothes, because they are handled by workmen who might infect them, will be subjected to disinfection by

airing, immersion in water, washing, and chemical means, such as the chlorides of lime and soda, &c., according to the nature of the gods. Letters and despatches, which are exposed to contamination by the touch of persons with Diarrhea, are in the list of arthes to be disinfected.

## 4th.—Living Animals.

The Committee considers there are grounds for subjecting the 'to restrictive measures and disinfection in circumstances to be od, of by the sanitary authorities.

different means fitted to purify places and articles contaminated by the choleraic gern. The means are the air, water, fire in certain cases, also chemical substances recommended by science and noted in the Report on Hygienic measures. Disinfection is applicable to ships arriving from infected places, and on board of which there have been either a severe epidemic or isolated cases of Cholera, or only cases of Choleraic Diarrhaa.

- 2. It is applicable to clothing and articles in use, as well as to persons undergoing rigorous quarantine, whether in the lazaret or on board ship,
- taminated, such as rays and skins, hides, feathers, and other animal substances, as well as wool and other articles not in bales coming from an infected place, or from a ship that is subject itself to disinfection. Letters and despatches will be enclosed in a box, and disinfected with chlorine without other process. Goods in general coming from manufactories and well packed in bales are not reputed to be contaminated, and consequently arenal liable to disinfection.
- 4. Lastly, disinfection is applied to living animals by airing or immersion in water, when the sanitary authority judges it to be fitting.

#### CHAPTER V.

#### THE BILL OF HEALTH AND THE DECLARATION.

The presenting the Bill of Health, together with the violal declaration (arraisonnement), makes up what in sanitary administration is required in the (reconnaisance) examination of an arrival from sea. The Bill of Health is to a ship what a passport is to a traveller. It certifies the state of health of the place of departure and of the places touched at, and the sanitary thorities enter in it, when they happen, the cases of diseases to quarantine that have occurred on board.

XVII.—Ought there to be three kinds of Bills of Health,—the foul, the suspicious, the clean.

The foul bill is that which is given at a port where Cholera prevails: the clean bill is given when there is no Cholera. It is the same with regard to other transmissible and contagious diseases. The suspicious bill does not say whether Cholera exists or not, but leaves the state of health of the port of departure doubtful, because, although the place itself is healthy, it is in communication with an infected locality, or because there have been cases of illness of a doubtful character. The Committee, after having discussed the question, proposes to discontinue the doubtful Bill of Health, and to continue the clean bill and the foul bill, the one testifying to the absence of Cholera, the other attesting its presence, and also its amount.

XVIII.—When ought Asiatic Cholera to be mentioned in the Bill of Health, and when should the mention of it cease?

Even a single case of Cholera, the first that may have shown itself, ought to be noted in the Bill of Health, because the first case, when an epidemic breaks out, is quickly followed by others, and it is very important that precaution should be taken against importation at the beginning of an epidemic. If one or many ships are allowed to leave with a clean bill after one or two cases, there is no assurance that the succeeding cases may not manifest them-

selves on board those ships, as they before departure were exposed to the same chances of contagion as the inhabitants of the they have quitted.

It is necessary, however, to determine what should be understood by the first cases that mark the beginning of an epidemic. It is necessary to distinguish between Asiatic and common As it is a fact, the Committee says, that Asiatic Cholera in imported disease in Europe, if, in the absence of an epidemic, all at once appear one or many cases of Cholera that cannot od with a centre of Asiatic Cholera, it is evident that is very different from that which it is important to mention in the Bill of Health. But, on the contrary, if the first cases that show themselves in a place may be connected with an epidemic prevailing in the neighbourhood, or farther off-if, in short, there is fear or threat of an invasion of Asiatic Cholera, the first cases should be noted in the Bill of Health. Error is apt to be caused by confounding the terms—cases of Sporadic Cholera and Sporadic cases of Cholera—they are very different. expression means isolated cases of common Cholera, Cholera nostras; the second means isolated cases of Asiatic Cholera. is the latter that it is important to mention in the Bill of Health.

The Bill of Health should continue to give the number of cases until the epidemic ceases, and, from the day on which the last case was observed, it should be noted that since such a date no new case has occurred. This note will guide the sanitary authorities at the place of arrival with regard to free commerce.

It would be imprudent to allow free intercourse on the simple announcement in a Bill of Health that Cholera had ceased. This cannot readily be ascertained in a large town, and there may be fresh outbreaks after short intermissions. The Committee believes it to be a necessary precaution that there should be a period of fifteen days between the cessation of the epidemic and the granting a clean bill. In conclusion, the Committee is of opinion that the Bill of Health ought to mention Asiatic Cholera from the appearance of the first case until the last that marks the close of the

epidemic. That the sanitary authorities ought not to allow free commerce to arrivals from a place where an epidemic has prevailed until fifteen days after the date of its complete disperance.

XIX.—Is it not absolutely necessary, as a guarantee for the health of the public, that a ship should have but one Bill of Health granted by the sanitary authority to the port of departure? And is it not equally necessary that the bill be not changed until the arrive wessel at its final destination?

The bill gives assurance of the health of the places left and touched at. It specifies the number of persons on board, the kind of cargo, and whether the ship was in quarantine or had free intercourse at the time of departure. It is, therefore, necessary that there should be but one bill, and that it should be granted by the sanitary authority, who alone knows all the circumstances, and is responsible for entering them in the document. It is often the case that the master of a vessel has three bills -one from the sanitary authority, the second from the Consul of his country, and the third from the Consul of the country to which he is proceeding. practice is attended with danger, not only because these documents sometimes do not agree, but because the masters of vessels, to escape restrictive measures, can clude the vigilance of the authorities, by presenting in an infected port one of the bills which has been given them with an entry of Cholera, then subsequently in another and healthy port the clean bill of the original place of departure.

There is another custom that is hurtful. The sanitary authorities of some countries exchange the original Bills of Health of the place of departure for new bills, which they grant to ships touching before they have reached their final destination. They thus deprive the authorities at the places subsequently visited of the only document which should inform them of the preceding circumstances of the voyage, and of the health of the original port of departure.

The Committee recommends that the form of Bill of Health of the International Sanitary Conference at Paris should be adopted, that it should be printed in two languages, that of the country are rench, as is the practice in Turkey and the Russian ports of the slack Sea. In conclusion, the Committee uses the very words of the question at the head of this section in answering it in the affirmative, and adds that the sanitary authorities ought to confine themselves to make entries on the original Bill of Health without relacing it with a new bill until the return voyage.

Committee also proposes that Governments that attach importance to the continuance of Consular Bills of Health should consent, for the sake of the public health, to substitute for them an entry on the bill granted by the sanitary authority.

## XX .- The Examination and Declaration in times of Cholera.

The declaration (arraisonnement) is the verbal declaration of the master of the vessel as to all the incidents of the voyage that are connected with the public health. If the master makes a declaration contrary to the truth he gets free entry, and the way is opened for Cholera. This took place in 1865 at Suez and at Constantinople. If he reports cases of Cholera on the voyage, then, even although he has a clean bill, the ship is subjected to rigorous quarantine. If the declaration is unsatisfactory, the arrival is held to be suspicious, and is placed under restriction.

In time of Cholera, ships with foul bills, and those which have had cases of Cholera on the voyage, ought to go to an appointed port to undergo rigorous quarantine. On entering they will carry the yellow quarantine flag. Ships with a clean bill, or liable only to quarantine of observation, can enter all ports. The flag which distinguishes them before free intercourse is granted is the yellow one.

Conclusion. The verbul declaration is of the highest importance in time of Cholera. Concealment and false declarations

render the best arranged restrictive system illusory, and compromise the health of the public. They ought to be severely punished by the laws of every country.

The Committee expresses the desire that to supply an ing want the Ottoman Government would, with the shortest delay, publish penal laws against infractions of the sanitary regulations.

## ABSTRACT OF THE REPORT

ON THE

# EASURES TO TAKE IN THE EAST

## TO PREVENT NEW INVASIONS OF

## CHOLERA INTO EUROPE.

THE Committee was composed of Count de Lallemand (President), M. Kalergi (Secretary), M. de Krause, M. Vernoni, Drs. Bosi, Bykow, Fauvel (Reporter), Polak, Salem, Sotto and Van-Geuns.

The Report was dated the 20th August 1866, and was signed by eight; the three others, M. de Krause and Van-Geuns and Dr. Polak, left before the work of the Committee was finished.

The Committee divides its work into two principal parts, one treating of the measures to take in India, the other those to take in the countries between India and Europe. It then arranges methodically, in those two divisions, all the questions that appear connected with the problem under consideration. The Committee deems it useful to seek the solution of the two preliminary questions which are comprised in the first chapter of its Report.

## CHAPTER I.

#### PRELIMINARY QUESTIONS.

QUESTION 1st.—If the inconvenience accruing to commerce and to international relations from restrictive measures were weighed against the disturbance to industry and commercial transactions attending an invasion of Cholera, which would preponderate?

This question presupposes that quarantine is efficacious of the importation of Cholera. The inconveniences caused time are in proportion to the extension of the disease, and the activity and importance of the relations that the countries subjected to restriction have with other lands.

A country in quarantine sees its relations disturbed, its export trade hindered by the obstacles it meets in the places where restrictive measures are in force. The more severe those measures and the less foreseen, the injury is the greater. To the detriment caused by the loss of time there have to be added the expenses connected with quarantine, which raise the price of goods.

But epidemics of Cholera at any given place are not usually long, consequently the restrictions they bring are transitory. Eminent merchants, it is said, remarked to the Committee that when quarantine was once removed, commerce would immediately resume an activity that would compensate for the loss sustained. The inconveniences of restrictive measures are chiefly felt in the country that imposes them.

In a country that is the prey of epidemic Cholera, trade and industry are immediately suspended; the mass of the public thinks only of escaping death; transactions are confined to things absolutely necessary; there often is famine, always rapidly increasing misery for the people; and ruin would soon have to be feared in a commercial or manufacturing city, if this state of things were prolonged, or often repeated.

According to the testimony of merchants whom the Committee consulted, the loss occasioned by restrictive measures is as nothing comparison with the incalculable evils caused by the troubles in epidemic such as that which prevailed at Constantinople in 185, and of which the disastrous effects were still far from being repaired. A country stricken with Cholera suffers doubly, whether quarantine measures are taken against it or not. It suffers from the disease, and also in its commercial interests. It has to be narked that it is not the merchants who complain most of ective measures; it is the idle, the tourists whose pilgrimages red.

the interest of all to take suitable measures to arrest the invading progress of Cholera, since these will not aggravate the confusion in transactions with infected countries, and because through them the injury caused by the ravages of the disease will be avoided. And as the countries which are most exposed to Cholera, and which believe that their supreme interest is to guard themselves from it, will never abstain from such measures, it follows that it is for the common interest that an international understanding on this subject be established.

Conclusion—Restrictive measures, known before hand and suitably applied, are much less prejudicial to commerce and international relations than the disturbance which affects industry and commercial transactions in consequence of an invasion of Cholera.

This is adopted by all the members of the Committee, except M. Van-Geuns.

QUESTION 2nd.—Ought we not to start from the fundamental principle, that the nearer that quarantine measures and preventive means are applied to the primary source, the more we may reckon on their efficacy?

The inconveniences of quarantine measures increase with the diffusion of Cholera, in civilized countries, at the same time that

their efficacy diminishes, and it follows naturally that the nearer to the original source that measures can be applied and in lands less peopled than Europe, where the relations are less active, where natural obstacles to the march of the scourge exist, more the chance of arresting it will increase, and the less oner will the restrictive measures be, even if they are very severe.

It is well to inquire up to what point in the countries between India and Europe those measures can be applied with hope success. A look at the track hitherto followed by Cholera y entering Europe, will throw light on this subject.

By land Cholera leaves India by the North-West Provinces, thence it invades Afghanistan, then Persia by Herat and Meshid. From Meshid it was propagated in Bokhara, and then, crossing the steppes of Tartary on the east of the Caspian Sea and lake Aral, it reached Orenburg in 1829. The principal radiation from Meshid is westward by Asterabad and the shore of the Caspian to Tehran. From this capital it advances in many directions; southward to Ispahan; southwestward, by Hamadan and Kermanshah, it reaches Mesopotamia; northward by the shore of the Caspian, by Recht, Lenkoran and Bakoo; and from those ports it has reached Astrakan by sea in the three epidemies. It was by Astrakan that in 1830 and 1847 Cholera entered Europe. Persia is separated from Beloochistan by vast deserts, and has never been invaded by Cholera through that country.

By sea Cholera is exported from India westward and north-westward, from the Malabar Coast and chiefly from Bombay, where it is endemic. In consequence of this proximity and their numerous maritime relations, the east coast of the Arabian peninsula and the coast of all the Persian Gulf are the shores most exposed to its importation, and those where, after India, it prevails with greatest frequency, so much so that we might ask if the disease is not endemic on all the coast. From the Persian Gulf the disease has reached Busora and Bagdad. Muscat is subject to Cholera, and all the coast of the Hadramaut, to the entrance of the Red Sea, is rather often visited by it; but Mokulla ought to be

particularly mentioned. Ships coming from India frequently revictual there before entering the Red Sea, and it is thus exposed attacks of Cholera, and may become a centre of propagation.

Other Indian ports, besides those of the Malabar Coast, contribute to the exportation of Cholera, but it is chiefly southeastward, to Malacca and the Dutch islands, that it is carried from Bengal. Singapore merits special attention, as it is not only a part mart for commerce, but, from its constant intercourse with Indian peninsula, it appears to be also a mart for Cholera; besides, the gathering place of a considerable number of ight to ten thousand yearly embark there for Mecca.

Last year, 1865, it was ships (under the Ottoman flag) from that place that suffered most during the voyage; and if it is added that the embarkation of pilgrims takes place there in circumstances that could not be more painful, it will be comprehended that for the Hijaz, arrivals from Singapore ought to be reckoned the most dangerous.

Cholera is imported on the shores of the Red Sea either directly by ships from India, or indirectly from the secondary centres on the Arabian coast; and when, along with the pilgrims, it enters the Hijaz, and, being unarrested in its course, it invades Egypt, there is danger to the ports of Europe, and its importation into them is infallible, if it be not opposed by severe measures.

In considering the probabilities of being able to arrest Cholera issuing from India, it is seen that its track by land is from the Punjab. Although the roads leading thence are not very easy, and are very well adapted for restrictive precautions, there is no hope for the institution, in the barbarous countries through which they lead, of measures fitted to aid the natural obstacles to the extension of Cholera. The Committee believes that much more is to be expected from a system of precautions organised in the Punjab itself by the care of the English Government.

Persia, the principal victim of the emissions of Cholera from India, both by land and by sea, becomes a secondary centre from which the disease radiates far. Although Herat, placed in a defile among high mountains and the desert, is, as regards Cholera, a strategic point, and the principal, perhaps the only passage for the disease, it is doubtful if the Persian Government has its hands the means of putting in force suitable measures or barring the passage. There would be less difficulty to encounter in opposing the disease on the maritime frontier in the Gulf, but that would require the co-operation of the Imam of Muscat, who holds Bundur Abas, and nearly all the navigation of its waters.

When Persia is invaded by the disease the difficulties incr.

It would be difficult to organise an efficacious barrier from the Caspian to Bayazid, but to the Russian Government of difficulty would not be insuperable. It has only to render perfect a system that has long been organized. The passage across the Caspian from Asterabad to Astrakan should be watched.

The line to be defended between Persia and Turkey extends from the junction of the Russian, Persian and Turkish, territories at Bayazid on the north to the head of the Persian Gulf, but if the Trans-Caucasian provinces are invaded the line would begin at Batoon on the Black Sea. This line is guarded by sauitary posts at its principal entrances, but, unless better managed than hitherto, the barrier in some parts will be illusory.

As regards the probability of arresting Cholera in its advance by sea, the Strait of Babel-Mandeb presents a natural barrier which it would be possible to oppose to the introduction of the disease into the Red Sea. It is, therefore, necessary to place the first obstacle there. If the Red Sea is invaded, then Egypt must be defended by the most severe measures. If Egypt is invaded, there will be little danger of extension from it by land; it is by way of the sea that danger is to be feared, and it would be best that Egypt should resign itself to the severest measures during the short continuance of an epidemic, to ensure effectual protection to the interests of Europe.

Conclusion.—The nearer to the original source that quarantine and other preventive measures against Cholera are applied, the less onerous and the more efficacious are they likely to be as regards the preservation of Europe.

#### CHAPTER II.

#### MEASURES TO TAKE IN INDIA.

Quished in India, or at least that its epidemic development can be restrained? With this view, will it not be proper, while carrying on the hygienic improvements already undertaken, to institute fresh investigations on the endemicity of the disease, investigations on the spot which will require much time, and which the English Government alone is in a position to undertake, to indicate the particular points on which the investigations should bear?

The essential cause of the endemicity of Cholcra is not known. It is not even exactly known what are the places in which it really exists in the endemic form; nor what connection there is between its endemicity and its epidemic development.

The Committee certainly does not pretend to dictate to the distinguished medical men who are already occupied with these questions as to the best way to follow in such an undertaking; but it cannot but give an opinion as to the particular points that appear worthy of attention.

It is known that Cholcra is endemic at Calcutta, Cawnpoor, Allahabad, Madras and Bombay, but there is no certainty that it is not endemic in other places. There is, therefore, room for more precision as to the places in India where endemic Cholcra exists. This is a statistical question.

Committee thinks that the peculiarities of the soil where the endemic is very manifest is, perhaps, the most important of the points to be investigated. Are the conditions which Pettenkofer regards as indispensable to the development of Cholera always found?

Are the localities where the endemic reigns distinguished by any exclusive peculiarities, whether in the position, the habitations, or as regards habits newly contracted, as in the burning of corpa in food, or in the state of misery?

All the investigations should aim at ascertaining if Cholera generates spontaneously, exteriorly to man. If, for example, being the product of a peculiar organic decomposition, it has its birth in, and is disengaged with more or less activity from the soil, like a palustral miasm—or if, as is more probable, the morbific principal once produced, is generated only in man; the ground and all is on its surface being only receptacles more or less from which the germ coming from the sufferer from Chole. The preserved, and from which it disengages itself with an activity varying with circumstances.

Is there not reason to believe that instead of Cholera being annually imported by the pilgrims from endemic sources, it rather exists permanently in the places of pilgrimage, and breaks out every year under the favoring circumstances produced by the concourse?

Lastly, since 1817, has Cholera at any time been seen in India to break out spontaneously in a locality until then exempt from the endemie? And, if so, has such a manifestation been the beginning of a spreading epidemic?

Independently of those investigations, the hygicnic improvements already begun should be followed with the greatest energy. And the Committee inquires whether it would not be admissible to adopt some precautions to restrain the exportation of the disease from its endemic centres.

The Committee is convinced that, in order to restrain the ravages of Cholera in India, hygienic measures ought to have in view all classes of the population; otherwise all the solicitude and all the admirable precautions with which the English troops are surrounded will not hinder Cholera from occasioning considerable losses among them, such as statistical returns now show, and as are likely to recur so long as the source of the evil among the

Natives is not restrained. To judge from the immense sanitary works begun at the principal towns of India, and the duties committed to the three permanent Sanitary Commissions, the English ernment appears to have perfectly understood this.

Conclusion.—The Committee does not think it impossible to succeed in extinguishing invading Cholera in India, and it believes that in every case its epidemic development could be restrained. To attain this double end it admits the necessity of continued investing, having for their object to ascertain the special conditions produce and maintain endemic Cholera, as well as the connection wists between this endemic and its epidemic outbreaks, at the same time pursuing the hygienic improvements already begun. As regards the particular points on which the investigations should bear, the Committee refers to what precedes.

QUESTION 4th.—From what we know of the principal part that pilgrimages bear in the development of Cholera in India, is it not desirable that heed be given to restrain, as much as possible, the influence of this cause, and to continue on a greater scale the use of the means already, during two years, employed with some success? To point out the measures?

The Committee states its opinion that Hindoo pilgrimages are of all the causes of epidemics in India incomparably the most powerful. It thinks that a person must be convinced that what has been enunciated in the General Report of the Conference as to the importance of those pilgrimages or fairs, far from being exaggerated, is, on the contrary, under the reality.

Mention is made of the measures taken at Conjeverar in 1864 by the advice of the Madras Sanitary Commission, and of the measures recommended for pilgrim camps by the President of the Sanitary Commission for Bombay, and the rules that were by him suggested to prevent the returning pilgrims from carrying Cholera into the towns and military cantonments.

The Committee asks if there is not a possibility of adding certain precautions to the measures already taken, and, with a view to lessen the concourse at the sacred places, if it would not possible to require that every pilgrim before his departure furnished with special permission from the authority under with he is, and which should not be granted except on proof that he has the means of supplying his wants during his journey. Such a condition would have the effect of keeping away from the pilgrimages the mass of beggars that flocks to them, and that is the chief aliment of epidemic Cholera.

The Committee can only propose this important without solving it, because it is to be feared that the nitrat it has in view may be such as would raise a dangerous opposition among the Natives. Of such a case the English Government is the only good judge.

The Committee praises the arrangements for the sanitary police of the places of pilgrimage, comprising the hygienic measures that have been mentioned, and expresses its desire that these may be made more general and complete, as experience may indicate.

It is on the return of the pilgrims, when Cholera has broken out, that the great danger begins. Against this danger the Government of Bombay has already, as has been shown, adopted certain measures, of which the principal, the Committee thinks, is to interdict the pilgrims that have Cholera among them from entering towns. But, the Committee asks, is the forty-eight hours quarantine of observation a real guarantee?\* It thinks not.

\* The adviser of the Government in this matter did not think this was all that was to be desired, but only that, if strictly enforced, it would be beneficial, as affording the two days that is so common a time, during an epidemic in India, between exposure to infection and the manifestation of illness. The proposing a longer detention, to include possibly more tardy development, would have had the appearance of giving greater security, but it was thought it would in reality frustrate the object from its being impracticable, as there was no law to enforce it, and armed force could not be contemplated. Even the two days detention was subsequently ruled to be legally impracticable. The people of Poona, however, have had the good sense to submit to the detention of their sick, returning pilgrims.

The Committee states its belief that the true means of hindering the diffusion of the disease would be not to allow the departure of the contaminated masses until after the complete ation of the epidemic among them, and after a general disinfection; but at the same time it acknowledges that this would be altogether impracticable with the immense assemblages at Indian pilgrimages. Such measures would presuppose a suitable place where the mass might be scattered and guarded, where neither shel-

nor food, nor drinking water, nor means of disinfection, nor sucto the sick, would be wanting. Nevertheless, the principle of
ring the dissemination of Cholera, the Committee says, is good
and should be acted on when there is the opportunity.

In recapitulation, it is important— \_\_\_\_\_

- (1st.)—To endeavour to restrict the number of pilgrims, by obliging them, if it be possible, to provide themselves before departure with a pass, which should be granted to those only who are proved to have the means of supplying their wants during the journey.
- (2nd.)—To establish in all places of pilgrimage a sanitary police, comprising the hygienic measures a/ready in practice, and to be completed in accordance with the teachings of experience.
- (3rd.)—In case of Cholera among the pilgrims not to allow the return of the contaminated mass (when such a measure is practicable), excepting after the complete cessation of the epidemic in the mass, and a general disinfection.
- QUESTION 5th.—Is there not need to use means to prevent the exportation of Cholera from India? Among those means is there not reason to particularize the institution of a sanitary police at the place of departure specially applicable to pilgrims, and in time of an epidemic that of a Bill of Health, &c.?

The means of preventing, or at least of lessening, the exportation of Cholera from India by sea are solely dependent on the English authorities, and the employment of them is not likely to raise all the practical difficulties which might be opposed to measures taken to extinguish Cholera.

Act XXI. of 1858, for the regulation of Native passer for ships, is the first step of importance in this matter, and even now it might be considered the bases of all the measures to be taken against the exportation of Cholcra. It has some imperfections and omissions. Thus there is the mistake that it is applicable only ships carrying the English flag, and consequently it is estimated by speculators who undertake to carry Moosulman in foreign vessels, and particularly under the Ottoman flag.

Could not the Act be applied without distinction to all the English ports in India? Even more, in the ports of all the powers who have Indian possessions, and to all ships of the class in 'question, whatever may be their flag? This should be viewed as an essential condition to be fulfilled.

Another circumstance to be noted is that masters of vessels under the English flag find the means of freeing themselves from obedience to the Act when they come to Judda. As an instance of this it is cited that in 1865 the ships North-Wind and Persia left Singapoor, which is subject to the Act, and touched at Mokulla, in preference to Aden, and, there being no English authority there, they escaped control, and finally reached Judda. At Judda could the contravention of the Act be dealt with? That there was contravention of it as regarded the number of passengers was very evident.

Another omission in the Act is, that English ships leaving a foreign port are not subject to it. The Sidney, that perhaps had no right to carry more than 500 or 600 passengers, took with impunity as many as 2000 on the voyage from Judda to Suez. It is desirable that the Act should be in force in all places.

In the details of the Act there is nothing said regarding the state of health of the persons embarked, and consequently nothing to hinder the embarkation of those having the premonitory signs of Cholera. There is no mention of measures that would neces-

sitate a good sanitary condition of the ship on its arrival. The Act; however, with certain extensions and additions, would answer end as regards the embarkation of the pilgrims.

This Act is only applicable to the hygienic conditions of the ship and its fitness for sea, but no ship leaving India should be exempted from being furnished with a Bill of Health, certifying to the health of the place of departure and the number of persons barked, and the Bill of Health should be examined at the interate ports touched at in conformity with the rules adopted in

sanitary authority at the place of departure, and consequently there should be a Medical Establishment organized for this, especially in ports named for the embarkation of pilgrims. Among such ports Singapoor deserves particular attention.

The Committee asks, if in case of an epidemic of Cholera at the place of departure it would not be possible to prevent the embarkation of pilgrims at the place, or to delay it until the end of the epidemic, or to render the conditions of embarkation more severe than usual? But these are delicate questions, and it is necessary to leave the solution of them to the competent authorities. Another question of the same order is, if it would not be possible to exact from every Moosulman pilgrim from India before departure the proof that he has the means of meeting the expenses of his journey?

The Committee mentions that the Dutch Government in its Indian possessions, wishing to reduce the increasing number of pilgrims to Mecca, made it obligatory for every pilgrim to have a passport which cost 110 florins. The High Court of Justice, having found this to be illegal, suppressed the passport in 1852. The number of pilgrims, however, increased greatly, and the Government judged it necessary again to require a passport, which was granted on certain conditions, of which the chief one is that the applicant has proved that he has the necessary means for his journey going and returning, and that he has made suitable arrange-

ments for the maintenance of his family in his absence. Perhaps, it would not be impossible to extend this to the English possessions in India.

Recapitulation.—It is of the highest importance to prevent the exportation of Cholera from India by sea.

For this end the Act of 1858, entitled the Native Passenger Act, would be the principal means, if it were made applicable to all flags without distinction, and if it were complete with regardant sanitary precautions.

Besides, it is of importance that every vessel leaving an Indian port should be furnished with a Bill of Health, granted by a sanitary authority appointed for the purpose, who would at the same time have to watch the fulfilment of the rules relative to the embarkation of pilgrims.

And the Committee believes there is reason to consider the questions, whether in case of an epidemic at a place in India it would not be possible to prohibit, or to defer, or to restrict, the embarkation of pilgrims at that place; and lastly, if, after the example of the Dutch Government in its Indian possessions, it would not be possible for the English authorities of India to require of every Moosulman pilgrim proof that he has the means of meeting the expenses of his voyage and of the maintenance of his family during his absence.

#### CHAPTER III.

ASURES TO TAKE IN THE COUNTRIES BETWEEN INDIA AND EUROPE

A.—Against the importation by sea.

QUESTION 6th.—Would it not be suitable to institute at the entrance of the Red Sea, on an island if possible, a sanitary establishment, where all ships entering that sea would be submitted to examination, and would, if there was need, be subjected to quarantine measures? If so, what ought to be the character of the establishment, by whom, and how should the measures be enforced?

The utility of such an establishment has been theoretically established by what precedes. The present question is its practicability. Whether at the entrance of the Red Sea there are the conditions indispensable to its working, namely, a suitable position, security, salubrity, safe anchorage, sufficiency of drinking water, facilities for supplies. It is clear that if such conditions are not met in a reasonable degree in any part of its waters, the establishment cannot be instituted. If all the requisite conditions were found combined, it is not impossible that considerations of another nature might form an obstacle to an establishment of this nature.

A great quarantine establishment at the entrance of the Red Sea ought to be at the same time both a lazaret and a post of observation, and consequently should be situated so as to be able to watch effectually all ships entering, and, besides, should have the means of subjecting contaminated vessels properly to the prescribed measures. Those conditions imply the greatest possible proximity to the Strait of Bab-cl-Mandeb.

The island of Perim is in that situation dividing the narrowest part of the Strait into two unequal passages. The greater passage, between the island and the African Coast, is fourteen miles wide; the smaller, between Perim and Cape Bab-el-Mandeb, or rather

between Perim and Pilot Island that is separated from the Cape by a narrow channel, is four and a half miles wide. Ships can pass on either side of Perim. The island of Perim is four and a half miles long and two broad, and it rises 230 feet above to sea level. It is a rock entirely bare, and without fresh water. On its south-west side there is a good port, but it is small. This last inconvenience is compensated by good anchorage at a little distance, near Cape Bab-el-Mandeb. The English Garrison receives all its supplies, including water, from without.

The position leaves nothing to desire, but the Committee not think it suitable for a lazaret, where a large number have to be sheltered and fed. However, Perim is the best place for the location of the maritime force required for the examination of ships and for watching the Strait.

A place for a quarantine establishment presents itself at a little distance outside the Strait and on the south-east of Cape Bab-el-Mandeb. It is a flat shore of easy access, where there are palm trees, and where good water is reported to be found. There is good anchorage under shelter of the Cape and the islands.

There thus appears to be the possibility of establishing at the entrance of the sea a post of observation, which would be chiefly on Perim, and a lazaret, to which infected arrivals might be sent after examination. The Committee adds that this is but a suggestion, and that a full investigation on the spot would be indispensable. Besides the places named, there is none known that is suitable outside the Strait. There is no information regarding Obokh, the French possession on the African Coast. The large island Harnish has no resources; Jubulzoogur, although having a little water, some vegetation, and some good anchoring ground, does not possess other requisite conditions. The island of Kamaran near the Arabian Coast, between Hodeida and Loheia, has water, supplies, and safe anchorage, and it is near Yemen, which ensures facility in victualling. But it would be difficult to avoid dangerous communication with this the most populous and the least civilized part of Arabia. It would, besides, be very difficult to hinder contraventions at Kamaran, or to oblige suspicious vessels to go there.

The sanitary establishment would be attended with great expense; it would require a large number of persons, and a considerable Military and Naval Force, to carry out the prescribed means are sures. Neither Turkey nor Egypt could take the management; England would be capable of doing so, but would it consent? And then would there not be great objection to entrusting the key of the Red Sea to one Power?

After discussion, the Committee concludes that the projected ution should be international, that it should be established naintained at the expense of the Powers interested, and placed under the superintendence of a mixed Council, with a delegate from each nation. The Committee repeats that the international character of the Council is a condition 'sine qua non' of the sanitary establishment.

Every ship entering the Red Sea ought to be subjected to examination, to ascertain its state of health, or at least (for that is always possible) the sanitary condition of the ship. the result of the examination, the ship would be authorized, by an entry or countersignature in the Bill of Health, to continue its voyage, or would be detained in quarantine, if, from the nature of casualties, overcrowding, the place of destination, or any other circumstance, the free entry of the ship into the Red Sea be judged to be dangerous. Regular packet-boats, and, in general, ships offering certain specified guarantees, while being under obligation to submit to examination, might be allowed to continue their voyage, even in case of choleraic casualties, on condition of performing quarantine at the place that would be assigned for them. But that such measures may be carried out with the impartiality, intelligence and firmness, that are desirable, their execution should not be entrusted to any one Power.

The Committee concludes that the measures be applied in virtue of international regulations, which should particularize the cases, and by an authority subject to the control of the Governments interested.

QUESTION 7th.—The pilgrimage to Mecca.

The organization of a Sanitary Service on the Coast of the Red

This organization would comprise posts for medical men, whose duty it would be to give correct reports of the health of the country; to grant and to examine Bills of Health; to watch the execution of hygienic or other prescribed measures; and also certain lazaret posts particularly appropriated to the carrying outpof quarantine measures.

The posts of the first kind should occupy the principal trading ports on both shores. On the African side it is indispensable that Koseir, Sooakin and Musowa, be watched. They are all under the Egyptian Government, and at the two first there is already a sanitary service. On the Arabian shore there would be difficulties in organizing a sanitary service, owing to the number of places to watch, and the ferocity and the fanaticism of the people, who are not under the Ottoman dominion, and are hostile to any European interference. There is not, however, absolute impossibility of effecting it. The seat of the office having the direction of all the others in the Hijaz should be at Judda. Yambo is another important place. There should be a third post south of Judda, either at Leeth or at Gonfonda, if it could be placed there with safety.

As regards the lazarets, the Committee makes distinction between the place where pilgrims affected with Cholera would perform quarantine, and where ordinary arrivals would be subjected to preventive measures. The danger is not the same, and the means of isolation that suffice for a small number of travellers are not applicable to a multitude, such as that of a pilgrimage. It was thought that there should be reserved for pilgrims returning by sea three places, where in case of Cholera among them they would be admitted to perform quarantine. They were in order from south to north on the Arabian Coast, El-Wesh, Moilah and Tor. The Egyptian Government, however, is epposed to Moilah, from apprehension of clandestine communication with the

Egyptian shore, and it is, therefore, omitted. Tor would be reserved for ordinary arrivals with Cholera. El-Wesh would be appropriated for the quarantine of pilgrims. It is five days' march not h of Yambo, and is under the Egyptian Government, which keeps a garrison in a fort at some distance from the sea. The port is large and safe, and is accessible for large vessels; there is abundance of excellent water, both on the shore and in the neighbouring valleys; fresh food is easily procurable on the spot, without reckoning on revictualling by sea. Tor is a little town at the of Mount Sinai, with good anchorage and abundance of fresh It can easily be victualled from Suez.

The Committee is of opinion that quarantine should not in any case be performed in the neighbourhood of Suez, as, for instance, at the Wells of Moses. At Suez there should be a post of observation, and it should be the scat of the direction of the whole sanitary service of the Red Sea, which should be assisted by the proposed International Commission.

Conditions of departure, and precautions relative to the embarkation of pilgrims.—The Moosulman law requires that whoever undertakes the pilgrimage should have means sufficient for the voyage, and for the subsistence of his family in his absence. This is acted on by the Dutch Government in its Indian possessions, and also, it is said, in Morocco, Tunis, and doubtless in Algeria. Its adoption is recommended to the British Government, and also to the Turkish and Egyptian Governments.

The carrying of pilgrims by sea is at present left in the Turkish and Egyptian ports to the greediest speculation. It is urgently required that suitable arrangements should be made, and the Indian Native Passengers' Act, with the modifications that have been specified, should be applied.

Hygienic measures to put in practice in the places to which pilgrimage is made.—The Commission that was sent in 1865 by the Ottoman Government into the Hijaz took precautions at the sacred places, which consisted principally of removing the filth that encumbered the town of Mecca and other places; establishing

slaughter-yards out of the town; removing to a distance the pits for the maceration of skins; the establishing of an hospital of sixty beds; assigning asylums to the beggars who crowded the great Musjid and the streets; clearing out the filth from the servoirs of Arafat; cleaning the conduits that bring drinking water to Mecca; digging five hundred latrines at different places of the valley of Mina, and large trenches to receive the blood of the animals slaughtered; and preparing, at a considerable distance. other trenches in which to bury the offal. All those measures were accomplished, not only without resistance, but even with concurrence of the authorities of Mecca. It is of importance those measures be perfected and regularly carried out by the sanitary police. In addition, the pilgrims should be provided with abundance of drinking water. The temporary latrines should be filled up daily, and disinfected with quick-lime if possible. Encampments out of the towns should be arranged so as to avoid crowding and its consequences. Succour should be given to the sick, and Cholera should be treated separately.

Is there any measure to take in the Hijaz against the importation of Cholera by sea or by land'—Mecca being the place of concentration, if the port of Judda were closed the infected pilgrims would, nevertheless, reach Mecca by other ports. It would, therefore, be necessary to be able to stop the passage by land, but that does not appear to be practicable. The only thing that seems practicable is, if the Hijaz were free from disease, to subject to quarantine (without expecting great benefit) every contaminated ship arriving at Judda. The Committee places no reliance on any quarantine measures that could be taken in the Hijaz against the importation of Cholera.

Measures to take with arrivals from the Hijaz if Cholcia manifest itself there during the pilgrimage.—Pilgrims wishing to return to Egypt by sea should be taken to El-Wesh, there to perform a quarantine of ten days, and the ship that afterwards takes them thence to Suez with a clean Bill of Health, would have to call at Tor, and remain under observation twenty-four hours. The caravan for Egypt would, according to usage, halt at the station near

El-Wesh; it would there be inspected, and would not be allowed to proceed until after having been ten days exempt from Cholera. Pilgrims from India and other countries beyond the Red Sea would be allowed to embark on their return home, but would have to submit to the rules laid down by the sanitary authority of the port of embarkation.

The communications between the Hijaz and Egypt should not be re-established in less than ten days after the cessation of y sign of Cholera.

Question 8th.—Measures to take in case of an outbreak of Cholera in Egypt.

Egypt, as regards Cholera coming from the Red Sea, is a defile through which it must almost of necessity pass to reach Europe; but it is a defile at the outlet of which the disease radiates widely, owing to the maritime relations of the country with all parts of the Mediterranean. As a gate to be passed, Egypt offers a natural obstacle, of which advantage may be taken by concentrating there the means of prevention; while if only the radiations of the disease were opposed here and there, and but one weak point were left in the defence against an enemy so subtle as Cholera, it would be enough to occasion the loss to all Europe of the benefits of the measures adopted generally. If on the Asiatic or European side of the Mediterranean one coast were badly watched, or one unfaithful or negligent agent permitted any compromise, the whole of the defensive system would be ruined. As it is easier to oppose an invading enemy by shutting a narrow gate through which he must pass than by leaving him an open field, it is clearly for the common interests that the door of Egypt be firmly closed.

If the European Governments decided on interrupting all intercourse with Egypt during the epidemic by a blockade, the consequences would be that the epidemic would there run its course, and have neither more nor fewer victims than if the door towards Europe were open to emigrants. The inhabitants could still resort to dispersion by making encampments in the desert places of the

country, and, in all probability, the epidemic would in two months have become extinct, because in warm countries its course is more rapid than in Europe. The interruption would not hinder urgent communications that, with necessary precautions, could be allowed without danger.

It will be said, would the immense interests of commerce, and the transit to India across Egypt, and the Suez canal—so many interests of the first order—agree to such an interruption and allow it to be enforced? The Committee admits without difficulty that those great interests would view the proposed measure in a bad light, and does not in the least doubt that, if they were possible enough, they would oppose it. But that is not a question for the Committee; it endeavours only to establish that the interests embraced in the whole commerce of Europe, even those of the relations with India, should not be opposed to the temporary interruption of the communication between Europe and Egypt, if that interruption would have the result of ensuring Europe against an invasion of Cholera.

If Cholera, notwithstanding all precautions, were to appear in Egypt, there could be only the choice of two evils—the loss confined to the temporary interruption of communication with Egypt, or the immense loss caused by an almost certain invasion of Cholera in Europe. But in putting aside, for the present, the question of humanity, if the commercial losses on one side and the other were calculated, those resulting from the importation of Cholera from Egypt would be greatly in excess. The Committee proposes for the solicitous attention of the Governments which its members represent, the question—In the case of an epidemic of Cholera coming by the Red Sea and appearing in Egypt, while Europe and Turkey are free from it, would it not be proper to interrupt temporarily the maritime communication of Egypt with all the Mediterranean?

This was agreed to by all, excepting Salem Bey.

## B.—Against the importation by land.

In the first place, Persia is considered with reference to the means of guarding it from Cholera coming from India, and to

measures which might restrain the development of choleraic epidemics. Then are considered the precautions that Turkey and Russia would have to take against an invasion of Cholera when prevailing in Persia, or the neighbouring countries.

QUESTION 9th.—Measures to take in Persia, organization of a sanitary system, precautions connected with pilgrimages, the transport of corpses, &c.

It has been shown by what ways Cholera enters Persia, and Herat is, as it were, the gate by which it passes from Afghanistan. But Herat not being in its possession, Persia is unable to protect Meshid on that side. When Cholera has reached Meshid, the important pilgrimage to this town, as is the case in India, furnishes its chief aliment, and is the principal cause of the propagation of the disease. To this are to be added the numerous commercial relations that centre in that town. the most important pilgrimage, as regards the present question, is the one to Kerbela, and other places near Bagdad that are particularly venerated by the Sheeahs. This pilgrimage is performed at all times of the year, but the great influx is during the month of the Mohurum, when about sixty thousand Persians come to the neighbourhood of Bagdad. The Persians have the custom of carrying with them the remains of their relatives and friends, to bury them near the tombs of the Imam. Those human remains, exhumed in different stages of decomposition, are wrapped in felt, put into sacks, into panniers, sometimes into boxes, and are carried on horses or camels. But the worst is that the corpses of those who die on the journey are added to the old remains. in such way that every caravan as it approaches its destination carries a greater and greater number of putrid corpses. caravans resemble moving charnel-houses, that diffuse fetid exhalations far around them. The Committee thinks that in Persia, as well as India, the pilgrimages are a chief cause of the development and propagation of Cholera.

In the present state of things it is not in the power of the Persian Government to ensure itself against the importation of Cholera from India, either by sea or by land; but at least it might make some efforts to lessen the spreading of the disease in its own territory.

For this end there should be instituted in Persia a sanitary system on the model of that in operation in the Ottoman empire, that is, composed of a central administration, aided by a Council or Board of Health, half European, and having under it sanitary establishments at important places of the country, such as Meshid, Kermanshah and Tauris.

The Committee is of opinion that Persia might safely main a sanitary physician at Herat as a point of observation, and recommends it to do so. (The good to result from such observation in this case is not stated by the Committee.)

The hygienic measures approved of for India are believed to be equally applicable to Persia. The suppression of all pilgrimages during Cholera would be easier than in India, where there would, perhaps, be insuperable obstacles to it. Twice already the King of Persia has forbidden, temporarily, the pilgrimages under those circumstances. The granting of passports only to those who have the means of performing the journey should be put in practice.

As regards the exhumation of corpses, it would be possible, the Committee thinks, to render the practice inoffensive by making obligatory certain simple precautions, such as (1) not allowing the exhumation and transport of corpses, excepting during the three winter months: a law to this purport is already in existence, but it is not now in operation—(2) Requiring that corpses, whether fresh or in a state of putrefaction, be embalmed with disinfecting substances, among which bitumen is noted—(3) Requiring that the bodies thus embalmed be enclosed hermetically in metallic cases, tin plate for example.

The Committee thinks that Persia is generally salubrious, excepting on the borders of the Gulf and the shores of the Caspian, and would not have any great sanitary works to undertake.

## QUESTION 10th.—Measures to take on the Turko-Persian Frontier.

There is already a line of defence from Busora, and even from Fao, at the mouth of the Shat-el-Arab, to Bayazid on the north, a line which is prolonged, in following the Russian frontier, to Batoom on the Black Sea. Along this immense line there are the following sanitary posts—Batoom, Ardahan and Kars, which have each a Medical Officer of Health.

The great road from Tauris to Trebizond does not go through Tizid, but crosses the frontier at Kizil-Diza, four hours' march dient. There are here a Medical Officer, and a lazaret, where Persian caravans can perform quarantine. Proceeding southward, there is a sanitary station at Kotur, where also there is a Medical Officer; and at Van, east of Kotur, there is a post of observation. All those posts report to a Central Office at Erzeroom. The first post on the south part of the line is near Revendoz, at the pass to Mosul. This defile has been badly guarded this year (1866), as Cholera has passed it. Then there are the most important posts of this frontier—Sooleimanich, Khangeen and Mendelee. The Medical Officers of Health in charge of these and the one at Busora report to a Central Office at Bagdad.

This service may have been able to give good information regarding epidemics, but it has hitherto been powerless to preserve the Turkish territory from Cholera. This inefficiency proceeds from many causes—the extreme difficulty of watching so extended a frontier, the insufficiency of the means employed to do this, the feeble support, and often the ill-will, of the Governors of the Province, all which circumstances have combined to render useless the zeal of the sanitary Officers. The Committee suggests the necessity of improving this sanitary service.

The defence against maritime arrivals in the Persian Gulf. is still more insufficient. Taking into account the difficulties of all kinds that are in the way of a complete organization on this coast, it appears, perhaps, wiser to return to the old system that protected Bagdad on the south by sanitary posts on the barrier that rests on the Tigris and Euphrates before their junction at Korna.

On the receipt of intelligence of Cholera being in Persia, the Governor of the province of Bagdad should come to an understanding with the Persian authorities, either to suspend the pilgrimage or to allow of only small parties at a time coming to the frontier, where they would perform quarantine before visiting the sacred places. Corpses should not be admitted then, or at any time, on Turkish territory, unless embalmed as before specified.

Arrivals from the Persian Gulf should always be attentively watched at Fao and Busora, and suspicious arrivals should be subjected to suitable quarantine. It would be well that all sailing in those waters should have Bills of Health.

Question 11th.—Measures to take against importation by Bokhara

• and the steppes of Tartary?

The Russian Government has posts at the several passages of the river Ser-Durca, which is the frontier. The Medical Officer who reside in the forts on the banks of the river have to inspect the condition of the hordes of Kirgheez, and of the caravans that cross it. With the measures already taken, and what doubtless the Russian Government will judge suitable to add, Europe, in the opinion of the Committee, has not henceforth to fear the importation of Cholera across the steppes of Tartary.

Question 12th.—Measures to take on the Russo-Fersian Frontier.

Past experience and good sense show that the delta of the Koor is the part that it is of most importance to defend against an invasion of Cholera. The Committee asks itself if the defence is practicable, if this gate of Cholera can be closed, towards the land at Astara on the frontier, or towards the sea at Lenkoran and at Salian, or rather the isles of Sarce near it? it cannot say, but it is convinced the Russian Government, so much interested in the question, will neglect no necessary means to accomplish it. The system supposes an efficacious watching of the whole Russian

coast of the Caspian, and quarantine measures organised on new bases in the principal ports that have relations with Persia, and principally at Bakoo and at Astrakan, where already there are lazarets. The line of defence on the land now comprises a number of sanitary posts, of which the principal are at Astara, Belasoowar, Jebrail, Sharoora, and at Joolfa, on the road which leads from Tauris to Nukkshivan, where there is a quarantine establishment.

Major Francis' No. 18, dated

12th January 1866. Collector's No. 279, dated 27th July 1866, with accompaniments.

I have the honour to forward copies of the correspondence noted in the margin, relative to the introduction of Survey rates into the Sehwan Talooka of the Kurrachee Collectorate, and to request the sanction of the Governor in Council, in accordance with Section

XXV. of the Bombay Act I. of 1865, to the proposed settlement.

- Proposals for the settlement of this district were first submitted by Captain Haig in November 1863, which were approved of by Mr. Mansfield, and their introduction for the Revenue year 1863-64 was sanctioned; but a petition having been submitted against the settlement by the Zemindars of the District in the following year, it was referred by him to Major Francis, the Survey Commissioner, who, after personally visiting the district and carefully examining the lands of several villages himself, was convinced of the defectiveness of the classification, and considered a revision of the rates necessary. Major Francis' letter No. 18, dated 12th January 1866, which forms No. I. of the annexed correspondence, fully explains the objections taken by the Zemindars to the original settlement, and his reasons for recommending its revision necessary. reply of Mr. Mansfield, which sanctions the revision, it is unnecessary to quote.
- The revised assessment which has now been submitted makes, as will be seen from paragraph 3 of Major Francis' report No. 502, dated 17th July last, very considerable reductions in the rates of the Sailab lands [i. e., Sailab aided by Moke from Rupees

- 6.4.0 to 5.6.0. Sailab aided by wheel from Rupees 5.0.0 to 4.8.0; Sailab unaided by any irrigation from Rupees 3.12.0 to 3.6.0] in the assessment of which the principal faultiness of the first settlement consisted, and the result is a reduction of the total Jumma of Rupees 1,47,368, fixed by Captain Haig, to Rupees 1,08,509, or about 35 per cent., but leaving the total of the Jumma under the new rates 11 per cent. in excess of the average collections of the last past five years.
- 4. The revised settlement is undoubtedly extremely light, and it is to be regretted that the effect of the rates on the area under cultivation last year, as compared with the actual realizations, has not been compared, for I am inclined to consider that had this been done it would have been perceived how very low they really are. There is, however, a difficulty in correcting their lowness now, as Mr. Mansfield guaranteed the settlement originally proposed by Captain Haig for ten years, and I concur with the Collector (see paragraph 7 of Major Francis' No. 502, dated 17th July) in considering that we are precluded from levying any increase on the rates imposed in 1864, unless by a compromise wherever a reduction has in a cultivator's holding been made by the revised settlement.
- 5. As the revision only corrects errors made in the first guaranteed settlement, I would, notwithstanding the great reduction it causes in the realizable Jumma, recommend it for sauction, for, for the reason already stated, general increases cannot, I consider, be

Vide paragraph 3 of Major Lambert's letter No. 279, dated 27th July last, and paragraphs 9 and 10 of Major Francis' report. added at present where they might otherwise have been made. I would issue, however, no proclamation, but simply correct the account of each cultivator's holding according to the revised fates, wherever this

was practicable, in consequence of the total amount payable under these rates being less than the total amount assessed under the original assessment. This course should, I think, be followed whenever an application may be made to take up fresh land the rates on which have been reduced by the revision. This would give some trouble at first, but it is the only way in which the revision can be introduced without on the one hand breaking faith as to the guarantee given by the Commissioner, and on the other hand obtaining compensation

... for the reductions by putting on the incleases recommended in the revision. It is true that the guarantee ought not to have been given without the sanction of Government, but it would not be right to plead this now.

I have the honour to be, &c,

#### A. D. ROBERTSON,

Acting Commissioner in Sind.

Commissioner's Office, Kurrachee, 12th November 1866.

No. 18 of 1866.

To

S. MANSFIELD, Esq., •

Commissioner in Sind.

Sin,—I have the honour to submit the following report upon the petition of the Zemindars of Schwan Talooka against the Survey Scttlement of that district.

2. The first explicit objection to the settlement, which is given in

That no distinction is made between the Sailabee rates fixed on lands fitted to grow inferior description of crops (such as Ahur, Grain, Sursee, and Mutter), and those fitted for wheat.

the margin, relates to the rates of Sailabee cultivation, which are said to be fixed without regard to the productive qualities of the land, that is to say, that lands capable of growing only inferior crops, such as Sursoo and Mutter, have been

assessed at the same rates as the regular wheat-producing lands.

Sailabee cultivation, as you are aware, is dependent on water obtained from natural flooding. The main consideration in assessing such lands is to graduate rates by reducing them proportionately with the deficient supply as the flood waters tail off. It is impossible in most cases to define precisely the line to which the floods extend. In fact, the land flooded will vary according to the height of the inundation, a larger area being, of course, watered in a high than in a low inundation season. But although the line is not

definable with minute accuracy, it may be ascertained sufficiently near for all practicable purposes by the general character of the cultivation.

4. The classification rules for this kind of cultivation were devised with a view of meeting the peculiar feature in the water supply explained above. For if you will refer to the printed rules appended to my report you will perceive that this kind of irrigation has been

classed under three heads, which are described as follows:—

Class.	Value. Annas	Description-
	6	When the overflow is regular and sufficient to permit of a good crop of wheat being grown every year without fail.
2	4	When the overflow is not so regular as to ensure a crop of wheat being grown every year.
ું ક		When the overflow water remains too short a time to saturate the land sufficiently, or too long a time to permit of its being ploughed for a wheat crop, and consequently only inferior crops, such as Jamba and Mutter, &c., can be grown.

5. It is true that this system of classification had not been introduced in the Survey Department at the time the Sehwan Talook was classified. But Captain Haig adopted a plan of operations based upon the same general principles. Owing, however, to his classers being young and inexperienced men, the work was not carried out in the manner devised. Captain Haig has also explained, with regard to their operations, that the inundation was unusually high in the season in which the district was classified, and consequently that a much larger area than usual was flooded that year, and, as a further consequence of this high flood, he explains that a not inconsiderable extent of land fitted only, in the average season, for the growth of inferior crops, was that year under wheat cultivation. Taking the crop as their guide, the classers valued the lands thus cultivated exceptionably as regular wheat-growing land. The result is that land,

which, from its position with reference to the floods, is fitted only for the growth of inferior crops, has been assessed, as petitioners state, at the same rate as the land under the full influence of the Sailab waters, and capable of growing wheat regularly.

6. I regret to state that a careful examination of the lands of several villages has convinced me that this defect in the classification of Sailab lands is not confined to a few isolated cases, but prevails

According to the class of the village.

generally throughout the district. I have met with several instances of lands assessed at the full Sailab rates of Rupces 3-12-0

and Rupees 3-5-0 per acre, which are of uncertain cultivation, even for the inferior kinds of crops. The adjoining fields in some instances are charged only with the rate for Barance cultivation, that

- \* The Baranee rate. is to say, a rate of 8\* annas has been applied to fields adjoining those assessed at Rupees 3-12-0 or Rupees 3-5-0. There has been a mistake on both sides in these cases, for the field charged with only the Baranee rate, being at the tail of the flood, comes under the influence of Sailab irrigation occasionally, and ought to have had some addition to its rate on that account, whilst the other should have been decreased to the standard for the worst description of Sailab cultivation.
- 7. There is also another peculiar feature in the Sailab lands of the Sehwan Talook flooded from the Muncher Lake, which has not been properly estimated in the classification. I allude to the tract of land adjoining the water's edge of the Lake, which, owing to the water not receding from it till late in the season, is not available for cultivation at the season when wheat is sown, being fitted only for Jamba, Mutter, and such like inferior crops. The classification rate of these lands was slightly reduced on this account by Captain Haig, but not sufficient to cover the difference in value between them and the good wheat lands. It will be necessary therefore, as will be shown in the sequel, to correct this defect in the classification.
- 8. In paragraph 2 of their petition the Zemindars object to the Churkhee rates, on the ground that no reduction has been made for inferior lands, and no allowance made for fallows. In the course of my inspection I saw no case where reduction had not been made in the rates of this cultivation, both for inferior soil as well as inferior

water supply. If there is any defect in the rating of these lands, it will be found, in my opinion, to be on the side of liberality, for the classification rules, which appear to have been fairly carried out as regards this cultivation, provide liberally for all circumstances affecting inferior Churkhee cultivation. They are also incorrect in stating that no allowance has been made for fallows, for it is a leading principle in the settlement to estimate Churkhee and Moke Jowarry lands to be culturable once in three years, and the rate is based on this estimate of their capabilities.

- 9. In paragraphs 4 and 5 the Zemindars state the several cir cumstances for which remissions should be allowed, explaining the manner in which, in their opinion, they should be estimated. It is to be regretted that a promise of remissions formed one of the conditions of the settlement lease. I have all along been opposed to remissions, and expressed a strong opinion against the insertion of a clause on the subject in the settlement lease when the proposal came before me in Captain Taverner's report on the Kundiara Talook.
- 10. It appears to me that our settlement in Sind will be no improvement on the existing revenue system if they include a regular plan of allowing remissions.
- 11. The Schwan Talook supplies an instance this year of the impossibility of carrying out such a system. The claims for remis-
- \* I have not the Return with me, but state this from Rupees 30,000,\* and according to the course prescribed in the clause alluded to, every individual claim should be inquired into. I need scarcely say that it would be impossible for the Collector's Department to manage a settled district if such a system is continued.
- 12. I admit that there are special cases in Sind for which it is necessary to allow remissions, even in settled districts. Such, for instance, as for damage done by locusts, and by disastrous floods. But the circumstance of a field being said to be imperfectly flooded, or too much flooded or of a slight blight to the crop, should not form subject of inquiry under a properly regulated settlement.

- 13. From what has been explained regarding the classification of the Sailabee lands of Sehwan Talook, it will be obvious to you that the rates for this cultivation must be revised. In fact, with your approval, I have already instructed Captain Haig to re-examine all fields at the head and tail of the flood line and make a systematic reduction of rates according to the plan prescribed in the classification rules. I shall request him to report the result for after communication to you.
- 14. With regard to the rates for this cultivation, the Zemindars complain of their being high. They would not, perhaps, have been thought so had they been equitably apportioned. I think, however, that as it is proposed to do away with remissions in future, except in the special cases of calamity referred to in paragraph 12, that on this account, and for the further reason of covering defects in the classification valuation, it will be advisable to make some reduction in the rates independently of the reduction which will be effected by the rectification of the original classification.
- 15. I have, consequently, instructed Captain Haig to reduce his original rates in the following manner, viz.—

Sailab aided by Moke irrigation, to be	Rs	89.		Rs.	as
Saliab aided by Moke irrigation, to be					
reduced from	6	4	to	5	6
Ditto by wheel irrigation, from	5	0	to	4	8
Sailab unaided by any irrigation, from	3	12	to	3	6

These reductions are for the first group of villages. A corresponding reduction will be made in the rates of the other groups. There is not much complaint of the good wheat lands with certain Sailab being over-assessed. I am, therefore, of opinion that the small reduction of 6 annas per acre will be quite sufficient in their case.

16. With regard to the claims for remissions this year, I think it will be found that the proposed rectification of the classification will include almost all cases in which they are really required. All claims under the heads of fields imperfectly flooded or overflooded will certainly be covered by that measure. There will remain, perhaps, for special consideration the cases of destruction by locusts, and, perhaps,

here and there a case of a large extent of waste land for which resignation was not preferred at the proper seasons.

- 17. I propose to make some further inquiry before submitting my opinion on the question of the number and date of revenue instalments, which forms one of the subjects of complaint in the petition.
- 18. The maintenance and repair of boundary marks is a work which devolves upon the Zemindars, and Paragraphs 7 and 8 of petition. petition for relief from it cannot be entertained.
- 19. No other part of the petition seems to call for any remark from me.

I have the honour to be, &c.,

J. T. FRANCIS, Major, Survey and Settlement Commissioner.

Camp Mehur, 12th January 1866.

No. 279 of 1866.

REVENUE DEPARTMENT.

# To the ACTING COMMISSIONER in SIND, KURRACHEE.

Sir,—In forwarding the accompanying report from Major No. 502, dated 17th instant.

Francis, I have only to remark that the assessment seems generally very fair. Gaher is the only village in which it appears to be reduced more than is necessary. It is considerably below the collections of the current year, though I gave large remissions. Still, however, I would not alter the settlement, which has been made with so much care, for this one case.

2. There appears to be a mistake in a few of the entries of present assessment, as may be seen from the following table:—

#### Present Assessment.

Deh.	As entered in	our	papers.	As in Major Francis' Statement.  Rs a p- 2,651 0 0 3,736 0 0		
	Rs	a	р	$\mathbf{R}\mathbf{s}$	a	p.
Kabrote	3,353	12	0	2,651	0	0
Mahee Ota	<b>4,</b> 960	8	0	3,736	0	0
Kureempoor.	9,095	10	0	8,185	0	0

- 3. I think that one of the two courses pointed out in Major Francis' paragraphs 9 and 10 should be adopted. It does not much matter which.
- 4. I have forwarded copies of Lieutenant Doig's paragraphs 12 to 15, to the Chief Engineer and the Engineer for Canals.

I have, &c.,

W. R. LAMBERT, Major,

Collector of Kurrachee.

Kurrachee, Collector's Office, 27th July 1866.

No 502 of 1866.

## To A. D. ROBERTSON, Esq.,

Acting Commissioner in Sind.

\*No. 178, dated 30th Mr. Manufield's letter,\* I have the honour to submit for disposal the accompanying report† upon the revision of the assessment of Sehwan Talook, prepared by Lieutenant Doig; whilst in charge of the Settlement Office.

2. On examining the details of the revised assessment proposed by that Officer, it appeared to me. judging from my personal know-

ledge of the district, to be desirable to increase the "Jumma" in some and decrease it in other, villages. Instructions regarding the modifications deemed necessary were therefore sent to Captain Wallace, who had meanwhile assumed charge of the Settlement Department, and that Officer has submitted the information called for. From Lieutenant Doig's original and these subsequent returns I have prepared the accompanying amended Statement, which shows the Jumma of each village as now finally settled.

3. The revision operations comprise an entire reclassification of all the Sailab lands of the district, combined with a reduction in the maximum rates for that cultivation, as shown in the subjoined Statement:—

Number of Class.	Description Ci Cultivation.	C	aptai Max	n H: baur	iig's n.	Revised	Max	inum.	
I. II. III. IV.	Sailab	{ }	6 5 4	-1	0	5° 4   4	8 8	0	Aided by Moke irrigation Ditto by Wheel ditto- Ditto ditto- Ditto ditto- Ditto ditto-

Lands under perennial irrigation were also examined, and some few alterations have been made in the rates; the result being embodied in the general statement regarding the revised assessment.

4. As explained by Lieutenant Doig, the revision operations have effected a reduction of thirty-five per cent. on the assessment fixed by Captain Haig, that is to say, the total Jumma as now settled amounts to Rupees 1,08,509, whereas it was Rupees 1,47,368, as imposed by that Officer. It is shown, however, in the comparison of results instituted by Lieutenant Doig, that the New Jumma is about 14 per cent. in excess of the average collections of the past five years, and it appears too from the Collector's report upon the remissions granted this season, that it nearly corresponds with the sum fixed, after a careful inquiry, for the current year's revenue of the districts.

- 5. These several comparisons tend to show that the district can pay the revised assessment now fixed. The reduction made is intended to cover the fluctuations to which Sailab cultivation is ordinarily subject from a high or low inundation season, and I trust we shall have no occasion for remissions on this account in future. It is scarcely possible, perhaps, to dispense with them altogether in a country subject to disastrous floods, and visitations by locusts, but they ought certainly to be required only in cases of special calamity of the above nature.
- 6. In my former report on this subject the causes to which the defects in the original settlement are attributable have been fully explained, and I regret to observe that the classification has been found to be more faulty than it was supposed to be. I need not, however, allude further to this subject, but would merely observe that I am satisfied that the revised classification has been carefully executed under Lieutenant Doig, assisted by Mr. Wilkins, Assistant of the Left Bank Survey, who was transferred temporarily to the Kurrachee Collectorate for this duty. I can, therefore, confidently recommend the settlement for sanction.
- 7. In respect to the revision, the Collector has raised the question as to whether the fact of a guarantee of the former rates having been given for ten years, does not preclude our levying any increase on the said rates during the period for which they were sanctioned. The maximum rates now imposed, as has been already shown, are a decrease on Captain Haig's rates, but there are cases in which the assessment of individual fields has been increased, owing to a low and incorrect standard of valuation having been adopted in the original classification. The Collector doubts whether we can levy the increased assessment in these cases.
- 8. Section XXX. of the Survey Act, which bears upon the case, precludes the levy of a revised assessment based upon a fresh survey or classification of soils until the expiration of the period for which a settlement may have been guaranteed. But this rule forbids not merely the levy of the increased but of the reduced assessment also. I don't think the cultivators would object to the payment of the revised assessment on the grounds here alluded to.

but perhaps it may be well to place the matter beyond the chance of dispute.

- 9. I would propose, therefore, that a Proclamation be issued in the district, to the effect that in consequence of complaints of the manner in which the rates were fixed at the original settlement made in 1864, the Commissioner had directed a fresh classification, and a revision of the assessment of the district, notice is therefore given that the new assessment will be levied from the current year to the expiration of the lease.
- 10. Or, if this is not approved of, the original lease might be declared to be cancelled, and a new one granted for ten years. Either course would do, supposing it is thought necessary to take steps in the matter.
- 11. With regard to the Bard and Dingree Bunds, it appears from the Collector's letter that he has inquired into the matter, and written to the Canal Engineer about these Bunds.

But until some arrangement can be made for superseding the present plan of allowing the two sluices to be opened in alternate years, it will be necessary to allow yearly remissions for the lands which derive their water supply from the closed Bund. The Collector's proposal to estimate the remission at two-thirds of the fixed assessment seems fair, and I would recommend the plan being continued until the improvements in the sluices alluded to above can be carried out.

I have the honour to be, &c.,

J. T. FRANCIS, Major,

Survey and Settlement Commissioner.

Poona, 17th July 1866.

Forwarded through the Collector for any observations he may wish to make.

#### No. 4 of 1866.

#### REVENUE DEPARTMENT.

#### To the SURVEY COMMISSIONER.

Sir,—I have the honour to submit a Report on the revised assessment of the villages in the Schwan Talooka noted in Appendix B of your instructions No. 76, dated 4th February last, the re-classification of which has been completed.

- 2. The appended Statement in detail will, 1 trust, lay the result of the revision clearly before you.
- 3. The following points call for remark. In twelve villages the percentage difference between original and revised assessment (including in the latter the assessment on lands that have been long out of cultivation) is great. In the Dehs of Boobuck, Soopur, Gaher, Arbee, Kote Baroch, Trence, Abrah, Khubrote, Bootra, Sehwan, Mahceota, and Kurrumpoor, there is a large amount of waste or much inferior Sailab land, which necessitated considerable reduction in classification.
- 4. Notwithstanding the reduction in the Jummas caused by this revision, the Dehs of Soopur, Arbee, Kote Baroch, Khubrote, Bootra, Punjota, Khundewaree, Chunna, Sehwan, Hydrance, Sunpall, Maheeota, Sangpoor, Tundro Shah Bazee, and Arazee, still work out much over the average of past years, but they have been under light leases, or generally enjoying low rates; for instance, most of the area of "Khubrote" was under a lump assessment of one Rupee per acre to Bhawul Khan Rhind for some years.
- 5. Arazee and Tundro Shah Bazee are almost entirely Churkee Delis, and consequently not much affected by the revision.
- 6. The river having carried away a good deal of land in Kurrumpoor, its revised assessment is only a trifle over past averages. This Deh being annually subject to encroachments of the river on one side, and new land thrown up on the other, no dependence can be placed, as far as comparison goes, on the statement of its past realizations.

- 7. Abrah is a very small Deh in a corner between Boobuck and Billum, enjoying no superior advantages either as regard soil or water supply; still, though only growing inferior crops, it has paid highly during past years, owing, I think, to their being many cultivators, and the high rates prevailing in the adjoining Deh of Boobuck having been exacted. It cannot be classed higher than it now has been, as the Sailab is natural overflow unaided by either Moke or wheel, and I don't think it would be advisable to increase the maximum.
- 8. The village of Dero Hyatt has been excluded from the Statement appended, their being only a few perennial wheel numbers that had to be altered.
- 9. With reference to paragraph 6 of my letter No. 3, dated 27th ultimo, small "Khatas" may again have been unavoidably increased, but I think it will be found to no great extent-
- 10. Agreeably with paragraph 9 of your instructions, the three Dehs of Billum, Joohoo, and Bagh Yussuf, at present under lease, have been classified *de novo*, and their assessment calculated at the revision maximums. The result is shown, for your consideration and approval, in the accompanying Statement. The maximums seem to suit these Dehs remarkably well.
- 11. The Jummas of the twenty-four Dehs under report have been reduced in the aggregate 35.2 per cent., and stand 14.3 per cent. above past averages. But when you take into consideration the "Bezarees," that, as a matter of a course, are likely to be given, the assessment actually collected will not be so much over past averages; on the other hand in many cases the amount of waste bearing a light assessment will most probably be taken up, and prove a steady increase to the revenue. I have every reason therefore to think that the present revised settlement, if confirmed, will be found to work satisfactorily, be regarded as equitable by the people, and obviate future necessity or calls for remissions.
- 12. The question of the Bard and Dingerce Bunds is rather a difficult one, and might be definitely settled by the Engineering Department. I may, however, here notice in brief that these Bunds benefit Dehs on the one side and damage Dehs on the other, as they come into force respectively.

13. The accompanying rough sketch will, I hope, illustrate the following remarks.

The Nara at A separates into two channels, which bear a multitude of names as they go along, till they unite at B, and become the Nara again. At C the Dingeree Bund is erected, which throws the water down the Pairdooaree Canal, and at D the Bard Bund is situated, which checks and throws back the water into the Makkee Canal.

In the time of the Meers both these Bunds were put up every year; of late it appears to be the custom to open the Bunds alternately every two or three years, to give a passage for boats and supply the Munchur.

A sudden depression occurs about the line of the Bunds whence the water descends with a rush into the Munchur; hence the object gained by the bunds is that the water is checked and thrown back till it rises, say to the level of E, when it acquires sufficient headway, and goes off into the Pairdooaree, and waters the high lands; and the same with the Bard Branch.

- 14. The existing arrangement of opening the Bunds alternately will only entail constant remissions, as the irrigation is thus entirely changed from good Rice Moke to inferior Moke-Churkee, or total waste.
- 15. Masonry Bunds with sluices, or side escapes, and with lock gates to pass boats, appear the best solution of the difficulty; a plan that, it will be found, will meet with the approbation and cooperation of the Zemindars. This arrangement would enable the people to get a sufficient supply of water under control from both Bunds to flood their lands, which, when no longer required, could be let off; and it would also not be open to the objection of altogether stopping the supply of water to the Munchur.

I have the honour to be, &c.,

A. DOIG, Lieut.,

Deputy Settlement Officer, Right Bank Districts.

## Revenue Survey and Assessment.

No. 4472.

#### REVENUE DEPARTMENT.

# Bombay Castle, 1st December 1866.

Letter from the Acting Commissioner in Sind, No. 217, dated 12th November 1866—Submitting copies of correspondence relative to the introduction of Survey Rates into the Schwan Talooka of the Kurrachee Collectorate, and requesting sanction, in accordance with Section 25 of the Bombay Act I. of 1865, to the proposed settlement.

RESOLUTION.—The revised rates are sanctioned.

- 2. His Excellency the Governor in Council is decidedly of opinion that the guarantee given by the Commissioner must be upheld in the case of land now under cultivation, except in cases where the aggregate amount of a Ryot's assessment is below that guaranteed in the first instance. For example, if the total amount of a man's rental under the original settlement was Rupees 100, and under the revised one only Rupees 90, there is no objection to readjust the assessment on particular fields, even though in some instances the rent may have to be increased. In the case of all lands to be hereafter given in cultivation the revised rates should be enforced, whether in excess of or below the previous ones.
- 3. The requisite corrections should, as suggested by the Acting Commissioner, be made, not by proclamation, but in the account of each individual. This duty should be personally superintended by the Collector and his Deputies.

Chief Secretary to Government.

To

The Commissioner in Sind.

# SELECTIONS FROM THE RECORDS OF THE BOMBAY GOVERNMENT.

## MILITARY.

# REVISION OF MILITARY SALARIES.

MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

Dated 25th August 1820.

I have been led, by the numerous applications from Officers of the Staff for an increase to their salaries, most of which appeared extremely well founded, to examine the allowances of that branch of the Army, with a view to augmenting their pay when it is necessary, as well as to reducing the expense when it may be practicable.

The result has convinced me that an increase is required in justice to many departments, from the change of circumstances since the present scale was fixed, especially as the establishment allowed to Officers was in some cases taken into account in fixing their salaries, so that their allowances have actually undergone a reduction by the operation of the late orders for regulating establishments.

To show the changes which have taken place, it is only necessary to contrast the strength of the Army and the charges of the Presidency in 1796 and 1820.

The strength of the Bombay Army, King's and Company's troops, in 1796 was—

11,718
,
33,740
22,022
5,08,741
37,71,406
2,62,665
5,26,862
57,55,286
52,21,424
24,00,000
5,00,000
31,00,000
20,00,000

If the allowances were to be increased in the same proportion, they would require at least to be tripled; but as such an exact proportion is not at all required, the principle I first adopted was, to affix a salary to each appointment according to its absolute importance and responsibility, without drawing any comparison either with other times or other establishments.

Lists were accordingly prepared on this principle, which appeared, when laid before me, to be reasonable in themselves. I however thought it necessary to compare them with the allowances at Madras, and the result of this comparison, as well as my anxious wish to attend to economy, was my reducing them very considerably below those of the Presidency of Fort St. George.

The only instances in which I have allowed them to approach to the scale of that Presidency, are the Auditor General and Commissary General. Both of these offices are so responsible, the good administration of both is so essential to economy, and the former is so particularly invidious, that I do not think the sums I have proposed can be reckoned excessive. The rest are so moderate, as almost to speak for themselves. I have therefore contented myself with exhibiting in the accompanying paper, Section A, the allowances of each appointment in Bengal and Madras, those now in existence here, those proposed, and the increase of expense they will occasion.

The whole increase is only about Rs. 1,39,719.

They are in all instances on the lowest scale consistent with the nature of the offices. The subordinate appointments in particular are kept very low, as the increase in the value of the higher is itself an advantage to the expected successors.

The Regimental allowances, whether of the Officers Commanding Battalions or of the Staff, should be fixed on the same scale as those of Madras and Bengal (if that be not already the case); such I understand is the wish of the Court of Directors.

Battalions being of the same strength, the duties and responsibility are the same, and the troops of different Presidencies being now more than ever liable to meet on the same service, no difference should exist in their allowances.

The necessity of increasing the allowances of Officers Commanding Battalions has already been submitted to the Honorable the Court of Directors, and is of essential importance to the discipline of the Army, by fixing Officers in Command of Battalions, who would otherwise be constantly drawn off by the wish to obtain Staff appointments.

The arguments in favour of equalizing the Regimental allowances of the three Presidencies, applies to Officers Commanding Brigades and to Brigade Staff.

In looking to the reductions which may be practicable, it appears at first that little remains to be done; the two revisions which the Military Establishment has undergone in the year 1799 and 1807 having reduced it to the lowest scale. Some saving

however may still be made, and some other arrangements adopted that will increase the efficiency of the Army without adding to the expense.

The first point to consider, is the Military Divisions into which the country is formed, in which the following improvements may be introduced:—

#### Northern Concan.

The Concan being a narrow slip of country, with not above three Battalions scattered over it, it does not appear requisite that it should be divided into two Commands, while it would appear inconvenient, from its extreme length, to form it entirely into one.

From the Damaun River to Bancoot River may conveniently be attached to Poona Division, from which, in cases of disturbance, troops would most probably be sent, either by the Bhore Ghaut or the Passes from Joonere and Sattara, into the low country.

This tract would not require any particular Staff or Commandant. The Officer Commanding there would merely, as in other places, comply with the requisitions of the Civil authority for Military assistance, and make his reports to the Officer Commanding the Poona Division.

#### Southern Concan.

The tract of the country from the Bancoot River to the Portuguese territory at Goa, lying at a greater distance from Poona and Bombay, it may be convenient to have a Commanding Officer on the spot to refer to, and his having a Brigade Major attached to him would be sufficient Staff for all the duties of the Southern Concan.

#### Poona Division.

This Division may comprise the conquered territory above the Ghauts (omitting Khandeish) and the Concan, as far south as the river at Bancoot.

It should be, as at present, a General Officer's command.

# Province of Guzerat, Northern Division and Baroda Force.

It would be convenient to divide these Commands, so as to leave the West and the frontier towards Sind to one, and the East and frontier towards Malwa to the other; but from the manner in which the Guicowar territories are distributed, this could not be done permanently without breaking up the subsidiary force. It seems therefore best to leave these commands in their present state, although attended with some inconvenience.

## Province of Guzerat.

As the Baroda force, which cannot be placed under the General Officer Commanding the Province, is so much intermixed with that of the Northern Division, it will be convenient to remove that also from under the Command of the General Officer, who will now receive Khandeish in addition to his present Command. The multiplication of papers and delays of communication will also be saved by this arrangement.

The deviation may then be designated the Surat Division of the Army.

# Southern Division of Guzerat.

The beforementioned arrangement under this Command (which is at present merely nominal) is unnecessary.

The troops under it would be added to those in Khandeish, and the head-quarters fixed at Malligaum.

#### Cutch.

Might be retained as a small Government command, an active Officer being selected to hold it.

It will now be necessary to observe the appointments liable to reduction upon this plan:—

Southern Concan ..... 1 Paymaster.

1 Artillery Officer in charge of Ordnance. 1 Superintending Surgeon, whose du-

ties might be performed by the Superintending Surgeon of the Presidency. 1 Brigade Major to the Officer Com-Poona Division ...... manding the Division. 2 Superintendents of Bazaars. 1 Field Post Master. 1 Inspector of Hill Forts. 1 Quarter Master of Brigade at Poona. .......... 1 Assistant Adjutant General. Khandeish 1 Assistant Quarter Master General. 1 Paymaster. 1 Superintending Surgeon. 1 Persian Interpreter. Guzerat ..... 1 Officer Commanding the Southern Division.

Surat ...... 1 Barrack Master.

Broach ...... 1 Commandant. 1 Fort Adjutant.

1 Deputy Medical Storekeeper.

Kaira ...... 1 Barrack Master.

The Adjutants of Battalions acting as Paymasters, it appears unnecessary, especially within the Company's territory, to attach a General Paymaster to two or three Battalions; the abstracts may be sent to the nearest Division Paymaster, who will return bills on the Collector, or escorts may be sent for it to the nearest Presidency. This particularly refers to the Southern Concan, and I should write a reference to the proper authority, to ascertain whether it could not be adopted there, or whether it would be more convenient to put the payments under the Paymaster at the Presidency.

The practice of placing effective Officers in filling permanent commands, such as Anjar, Broach, Sholapoor, &c., appears objec-

tionable; I therefore propose that all appointments of that description be done away, and that a list of the commands be submitted to Government, to enable it to select such as are to continue.

Tanna should be made an Invalid Station, and commanded by an Invalid Officer. The Fort Adjutant should also be an Invalid Officer, and all small commands of such a nature that may be absolutely necessary, should be given to disabled or Invalid Officers.

Bazaar Masterships and Barrack Masterships at the outstations may be transferred to the Commissariat Officers.

With regard to Sub-Assistant Commissaries, it does not appear requisite that one should accompany every petty detail of Europeans, and I should conceive, that in many cases the duty could be more creditably assigned to intelligent Conductors of that Department.

The same observation applies to the Artillery Officers being nominated Assistant Commissaries of Stores upon every trifling occasion.

The Staff of the Bombay Army on the proposed footing would probably be as follows:—

## Bombay.

## As at present.

#### Tanna.

As at present, with the exception of having Invalid Officers there instead of effective ones.

#### Poona Division.

- 1 Major General.
- 1 Aide-de-Camp.
- 1 Assistant Adjutant General.
- 1 Ditto Quarter Master General.
- 1 Interpreter.
- 1 Deputy Commissary of Stores.
- 1 Assistant for Sholapoor.

- 1 Deputy Commissary General.
- 1 Assistant ditto Sholapoor.
- 1 Sub-Assistant ditto.
- 1 Superintending Surgeon.
- 1 Medical Storekeeper.
- 1 Paymaster.
- 1 Deputy or Assistant.

Poona.

- 1 Commanding Officer.
- 1 Brigade Major.

Sattara.

- 1 Commanding Officer.
- 1 Brigade Major.

Sholapoor. .

- 1 Commanding Officer.
- 1 Brigade Major and Officer from the Staff of the Division above referred to.

## Ahmednuggur.

- 1 Commandant.
- 1 Commanding Officer.
- 1 Brigade Major.

#### Surat Division.

- 1 Major General.
- 1 Brigade Major.
- 1 Aid-de-Camp.
- 1 Major Commanding the Garrison of Surat, the senior Officer of the troops stationed there.
- 1 Fort Adjutant, Surat.
- 1 Assistant Commissary of Stores.
- 1 Assistant Commissary General.
- 1 Garrison Surgeon and Medical Storekeeper.
- 1 Superintending Surgeon.
- 1 Deputy Paymaster.

#### Broach.

- 1 Officer Commanding the Detachment stationed there.
- 1 Assistant Surgeon.

#### Khandeish.

- 1 Officer Commanding.
- 1 Brigade Major.

## Baroda Subsidiary Force

- 1 Colonel Commanding.
- 1 Assistant Adjutant General.
- 1 Ditto Quarter Master General.
- 1 Assistant Commissary of Stores.
- 1 Second Assistant when the Force is in the field.
- 1 Assistant Commissary General.
- 1 Sub-Assistant \* ditto.
- 1 Superintending Surgeon.
- 1 Medical Storekeeper.
- 1 Deputy Paymaster.
- 1 Assistant ditto.

## Northern Division.

- 1 Officer Commanding.
- 1 Brigade Major.
- 1 Assistant Commissary General.

#### Kaira.

The Senior Officer of the Troops there Commanding.

A Cantonment Adjutant.

#### Cutch.

- 1 Commanding Officer.
- 1 Brigade Major.

If these arrangements be approved, it will remain to consider what part will require to be carried into effect immediately.

In the mean time I strongly recommend that the whole plan be kept secret, as the disclosure may tend to disappointment, even to discontent.

25th August 1820.

M. ELPHINSTONE.

### STATION COMMANDS.

# MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

Dated 2nd Octobor 1820.

I think Broach and Anjar might be abolished as Station Commands and left to the Senior Officer of the Garrison.

Sholapoor and Bancoot having Invalid garrisons, should be made Invalid Commands.

I am however doubtful whether it may not be convenient to retain such command as a provision for such field Officers as would otherwise do mischief at the head of their Battalion.

It is a question whether the convenience of this plan, or the evil of holding out a reward for inefficiency is the greatest, His Excellency the Commander in Chief will perhaps favour the Board with his opinion on this subject.

At all events, none of the appointments need be abolished till they fall vacant.

MOUNTSTUART ELPHINSTONE.

# IMPROVEMENT IN THE INVALID ESTABLISHMENT.

MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

Dated 2nd October 1820.

The improvement I have to suggest in the Invalid Establishment, goes no further than that there should henceforward be a Pension List distinct from the Invalid Battalion. The latter should remain on its present footing; but no Officer should be admitted into it without the most satisfactory certificate from his Commanding Officer of his good character and conduct. The Pension List, again, should be a receptacle for such persons as are unworthy to remain in the Army, but whom it would be inhuman to deprive

of all subsistence. These last might receive somewhat less pay than the Invalids, and should have no command and no military charge.

The whole of the present Invalid Battalion should remain as at present, but Officers belonging to it, who should hereafter misconduct themselves, would be liable to be transferred to the Pension List, in the same manner as Officers on the effective list. The Officer Commanding the Invalid Battalion should, in such a case, show no forbearance to the views of the Officers under him, but exercise the same vigilance as an Officer Commanding an effective Battalion, and take pains to clear his corps of every disgraceful member, either by Court Martial, or by compelling the offender to retire to the Pension List. Officers of merit, disabled by wounds or sickness, will then no longer be liable to be confounded with the outcast of the Service. His Excellency the Commander in Chief will probably be able to enlarge and improve on these hints if they should meet his approbation.

MOUNTSTUART ELPHINSTONE.

2nd October 1820.

# APPOINTMENT, SUPERINTENDENT CAVALRY.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

I formerly withheld my consent to this measure, because I conceived the two Regiments of Cavalry were completely disciplined (although I was surprised at the time in which it was effected), and that although it might therefore be very desirable to appoint a Superintendent or Inspector, it was not "absolutely necessary."

I infer from His Excellency's present letter, that the former two Regiments, though fit for duty, are not in the high state to which they might be brought by the superintendence of an experienced Officer, and that unless we give them that advantage, we are likely to have inferior Cavalry as long as we have an Army. I observe also, that His Excellency is of opinion, that the 3rd Regiment is not likely to be fitted for duty without some step like the present; for these reasons I now acquiesce in a proposal which I formerly thought might be dispensed with.

The examples of Bengal and Madras are not in point; the Cavalry of both of these Establishments was raised gradually, and it never was a question with either, whether they should leave these Regiments to take their chance of instruction, or secure it at once to them by the appointment of an Inspector. When such an appointment was made in favour of Colonel Gillespie, the Madras Cavalry was in its highest state of perfection.

MOUNTSTUART ELPHINSTONE.

# APPOINTMENT, SUPERINTENDENT CAVALRY.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

My former Minute having been founded on a construction of His Excellency the Commander in Chief's letter, which proves to have been erroneous, I have again examined the question.

- 1. If the 1st and 2nd Cavalry are now completely formed, officers and men, the chance of their falling off for want of proper superintendence, would not appear to me sufficiently great to render the appointment of an Inspector indispensably necessary.
- 2. On the other hand, if they are now in such a state as to render it probable that they will get into a loose or bad system if entirely left to themselves, I shall most cordially subscribe to the appointment of an Inspector. There are but two ways of providing for the 1st and 2nd, the aid of Colonel Stanhope's superintendence—the first is, to move them within the sphere of his com-

mand; and the second, to give him the power to visit and control them out of his immediate command. Of the two, the latter is decidedly preferable, as the two Regiments cannot, without great inconvenience, be withdrawn from their stations.

3. Supposing both the older Regiments independent of Lieutenant Colonel Stanhope's aid, we have still to consider the case of the 3rd Regiment.

I cannot think it at all reasonable that Colonel Stanhope should be expected to undertake the complete formation of the 3rd Regiment without a recompense. Had the question been put, when he began to discipline the two former Regiments, whether he should or should not have an allowance, I think it would certainly have been decided in the affirmative; but the question was never put: the Lieutenant Colonel began at once, and completed the Regiments for service without any reference regarding the mode of remuneration. A donation was then ordered for him, I think, about equal to the pay he would have received for the time he was employed, at 1,500 rupees a month. We have now an opportunity of deciding before his duties are completed, and I would propose that he should have an allowance of 1,000 rupees a month for the whole time actually employed in disciplining the 3rd; but in that case he could not be made Inspector, a title which could only be conferred on an Officer having charge of the whole Cavalry.

Whichever of these plans His Excellency the Commander in Chief shall consider to be necessary under the view that I have taken of the subject, I shall readily concur in; but it is impossible to appoint an Inspector, without its appearing that the present Officers are insufficient to raise their Regiments to the highest state of efficiency, or else to retain them in that state when already raised to it.

MOUNTSTUART ELPHINSTONE.

# APPOINTMENT SUPERINTENDENT CAVALRY.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

This being the case, I see no choice but to make the appointment. We cannot allow our young Cavalry to be neglected for the sake of avoiding the expense of an appointment of acknowledged necessity, and we cannot refer to the Court of Directors, because the period during which the appointment is required must expire before we receive the Court's answer, as the appointment must be confined in point of time to the period for which it is strictly necessary; and His Excellency the Commander-in-Chief may be requested to announce the time when he conceives the discipline of the Cavalry is independent of such assistance.

#### MOUNTSTUART ELPHINSTONE.

# COMPENSATION TO NATIVE ARMY FOR HIGH PRICE OF GRAIN.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The arguments on both sides of this important question are brought forward in the Minutes of the Auditor General and Adjutant General with remarkable clearness and ability. The substance seems to be this—

The Auditor General proposes that a sepoy should never spend more than two Rupees a month on his food; the Adjutant General never more than one and a half.

The Auditor General wishes to keep the condition of the sepoy as it stands. The Adjutant General wishes to improve it in some degree.

The Auditor General's argument rests on the supposition that the Army has gone on well hitherto. The Adjutant General

maintains that this cannot be admitted without considerable reservation.

It was unnecessary for the Auditor General to prove the success of our military system on the whole, which is sufficiently apparent; but the Adjutant General has shown beyond dispute, that in some respects it has been remarkably unsuccessful, and I think he has traced the case of our failure to the disproportion between the pay of the sepoys and the price of provisions.

The alleged disproportion is combated by the Auditor General on the ground of the superiority of the pay of a sepoy over that of a labourer, but this superiority is denied by the Adjutant General, and may be rendered null by comparing the excess of a Bombay sepoy's pay over that of a labourer in these provinces, with the excess of the pay of a sepoy over that of a labourer in Bengal or Madras.

After considering the arguments on both sides, I concurentirely in the opinion of the Adjutant General. I should do so even if the question were to be considered without reference to any external circumstance; but there are many considerations which weigh in favour of the Adjutant General's plan, besides those I have abstracted.

Our troops are liable to serve with those of Bengal and Madras, and it is important that they should find no advantage in the situation of those troops so obvious as to render them dissatisfied with their own.

For this reason, as well as from other considerations of justice and policy, the Honorable the Court of Directors have ordered that "the Regulations relative to the subsistence of the Native soldiery should be as uniform in all parts of India as circumstances will admit," and there is no circumstance in this case to prevent a more complete equality than at present exists. It is true that our common bazaar prices are much higher than those of Madras, but it cannot be maintained that, because our sepoys cannot save like those of other Presidencies in seasons of plenty, they are not to have the same protection against seasons of want.

These arrangements would all apply if things were to remain on their present footing, but as we are about to reduce the field allowances in the Deccan, the situation of the soldier would be greatly inferior to what it is at present, if no such relief were afforded. I think if this part of the subject had been known to the Auditor General, that the same honorable attention to the public interest which has led him to oppose what he considers an unnecessary expenditure, would have induced him to support a general change which is at once equitable towards the sepoy and profitable to the public. It cannot be doubted that the diminution in the number of desertions in late years has been in a great measure owing to the increased proportion of the troops who have been on field allowances, when these are reduced below even their ancient standard, while the greatest encouragement is held out to agriculture, we can scarcely expect but that the old disposition to desertion will revive and increase. It may be said, that as we now possess the country from which our recruits are brought, we shall always have the means of recovering deserters and of putting a stop to the offence. This, however, is an exertion of our power which I never desire to see; on the contrary, I think the possibility of our Government at some future period shutting up this wholesome vent for disaffection, is an additional reason for endeavouring to remove every motive for discontent among our sepoys.

In England, where a man will bear much before he will raise his hand against his king and country, the principle of compulsory service may be tried, not with perfect safety, as is shown by the mutiny of the Navy, but without imminent danger; in India, on the contrary, it can never be attempted without risking our empire. Almost our only hold on our sepoys is derived from good pay and good treatment; if either of these sources of attachment seem to them to be withdrawn, the least evil we have to dread, is that they will quit our standard. It is not difficult to see what would have been the result of any dangerous crisis if we had been able to retain in our ranks the 28,000 malcontents who deserted within ten years. The evils of the frequent loss of disciplined men are apparent, but they are not equal to those of a disaffected Army, I

am therefore of opinion, that no notice should even be taken of desertions, except to discover and remove the cause (whether general or partial), and I think it a wise proposal of the Adjutant General, to make the greater or smaller number of desertions the test of the fitness or unfitness of the present measure.

For the above reasons I concur in the opinion of the majority of the Military Board, that we ought to adopt the Madras standard for rice. I think we should adopt the standard of 15 pucka seers the rupee for wheat flour, to enable our troops to meet those of that Presidency on an equal footing, and that we should calculate a rate for bajree on the following principles. We should first ascertain the nutriment contained in it compared to rice, that is, how much of each will do for the daily subsistence of a man; we should then make a large deduction from the price of bajree, because, as almost all our sepoys cat rice, and it is a hardship for them to be reduced to bajree, they should find some compensation in the comparative cheapness of the latter grain. Supposing the price proposed by the Adjutant General to be adopted, the rule would then be, that as long as rice of the third sort could be bought at 37½ lbs. the rupee, or wheat at 30 lbs. (15 Bengal seers) the rupee, or bajree at 47 lbs., the sepoys should not receive compensation, but they should be entitled to it when all three grains should exceed their respective regulated prices. These prices should be avowedly experimental, as suggested by the Adjutant General; they should apply alike to troops on field and garrison allowances, and they should be applied under the direction of a Committee, as recommended by the Auditor General, except in case of small detachments, where some other must be fixed on. Followers may receive compensation on the principle recommended by the Auditor General.

If these principles appear correct to the Members of Government, the Military Board may be directed to draw up a regulation conformable to them, and may be requested to furnish it early, it being desirable that it should be published at the same time with the order doing away with field allowances in the Deccan, and that order should be published by October 1st and carried into effect on the 1st of December.

# COMPENSATION TO NATIVE ARMY FOR HIGH PRICE OF GRAIN. BAZAARS REGIMENTAL.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The important subjects referred to in these letters, have been very fully and ably discussed, and have been decided on by the Military Board with great judgment and discrimination. I concur with the suggestions of that Board in almost every particular, but I shall nevertheless remark on each subject in its order.

- 1st.—I entirely agree with the Board as to the expediency of keeping the charge of the Bazaars separate from the Commissariat.
- 2nd.—With regard to Brinjarries; as Sir J. Malcolm does not propose depending on them alone, and only mentions them as one of four modes of supply, it does not seem necessary to discuss their merits.
- 3rd.—On the important subject of compensation I concur with the Military Board and with Sir J. Malcolm. I think the present plan of granting occasional relief objectionable on various grounds; it encourages complaints, since no remedy is afforded until the evil is represented, and it leads to discontent, as the sepoy may complain in cases where Government does not think it necessary to afford relief; it exposes the sepoy to anxiety, as he does not know exactly what he is to expect, and it subjects him to temporary distress while his difficulties are undergoing a reference and a discussion at the Presidency. It is much better for Government to provide for all cases by an order suggested only by its own foresight and its attention to the interests of the sepoy. 1 doubt, however, whether the time for affording compensation ought to be fixed by the price of rice. The Military Board are perhaps the best judges on this subject; but the difference between the pay actually received by the sepoys during a period in which there were no complaints, and that they would have received on the Madras system (Rupees 95,200 a year), appears to me to show that

the price of rice cannot be adopted as a real index of the rate at which the food of a Bombay sepoy can be procured.

On the other hand, it may perhaps be found that the prices of the different dry grains rise and fall together, and that the same rule that was calculated for bajree would also answer for wheat; or if there be any one grain (bajree for instance) on which all classes occasionally subsist, it would be no hardship to confine the compensation to times when that grain was not to be had at a moderate price. Should neither of those suggestions be unobjectionable, perhaps some scale might be settled, founded on the average price of the three sorts of grain principally consumed.

The subject might be again referred to the Military Board, by whose amended opinion I should have no objection to be guided, and the Board might at the same time be directed to prepare an order rendering compensation permanent.

The Board might be requested to provide in this regulation the means of ascertaining correctly, by a Committee or otherwise, when compensation really becomes due, which perhaps ought only to be when the price on the average of a whole month was above the standard fixed by Government, and it might be recommended to them to be cautious in allowing compensation to followers, especially in cases when their pay may exceed the proportion which it ought to bear to that of the fighting men.

4th.—I shall make no observations on bazaars until the promised regulations are submitted by the Military Board, except that if bazaars were formerly desirable, they appear to be rendered absolutely necessary by the late orders depriving the Magistrate of the power of pressing for the aid of troops in motion.

5th.—The Code of Commissariat Regulations (B) has not been furnished. The object of the Enclosures 7 and 8 is not apparent. If they contain an answer to the inquiries of the Supreme Government, at the time when it was considering the propriety of prohibiting the pressing of Coolies, they will be too late, the question having been long since decided. The information they contain also would scarcely have been sufficiently minute to have been useful for that purpose.

Board in opinion as to the propriety of confining all immunities from customs on grain and other articles of food to registered and regulated camp dealers, and that I hope the Board will incorporate the manner of exercising the proposed control with the objects embraced by the Bazaar Code now under consideration. They will also, I hope, devise effectual means of checking all frauds by which the proposed immunity can be extended to others besides the dealer for whom it is designed. It may be a question whether some more direct mode of remuneration to camp dealers might not be devised, which would afford them the benefit they now derive from exemptions, without exposing Government to indefinite losses by fraud and collusion.

#### MOUNTSTUART ELPHINSTONE.

Since I wrote the above Minute, I have seen the proceedings in 1819 on the separation of the Bazaars and the Commissariat, and a knowledge of the doubts entertained, induces me to say more than I at first intended on that question. I conceive the principal duties of the Bazaar Master to be to procure passports and escorts for the bazaar people, to remove all obstructions to their trade, and to carry such of their complaints as he cannot himself redress to the Commanding Officer; he should also settle their disputes about their dealings, and he may or may not be entrusted with the Camp Police. He has nothing to do with fixing prices or with directing trade, nor do I think he can ever give much useful information to the dealers, except by telling them where they are likely to fall in with the enemy, or to be anticipated by the dealers of a co-operating division.

Almost the only duty of a Bazaar Master therefore is, to protect the camp dealers, and if so, there seems little question that it is better that there should be a distinct Officer to perform it, than that the dealers should depend on the Commissary, the interests of whose department are opposed to them, and whose servants they have most to dread as rivals and oppressors.

It is urged as an advantage, that the Commissary can influence the bazaar; but it is exactly to prevent that influence that I recommend a separate Bazaar Master. I see no occasion in which he can influence it beneficially, except by issuing public grain on very great emergencies to the dealers, which should never be done but by express orders from the Commanding Officer, for which purpose it is better the offices should be separated than united. So far from wishing the Commissary to influence the bazaar, I should wish him never to purchase in it, or within the immediate range of the petty dealers belonging to it.

Most of these remarks apply to a foreign territory, and I am not prepared to say whether there are equally strong reasons for the employment of a Bazaar Master within our old provinces; but where there is any duty of this nature, I think it would be better done by any other Officer than the Commissary.

With regard to the check afforded by the Bazaar Master on the Commissary's accounts, I consider it of less consequence than the check on the malpractices of his servants, but still I think it useful. It does not signify whether the Bazaar Master be better or worse paid than the Cemmissary. It is not the Bazaar Master who checks the Commissary's accounts; it is the record of the actual prices of articles in a free bazaar. Such a record could not in all cases be obtained if the bazaar were under the Commissary; but it will as long as it is under any Officer who has no inducement to influence or to misrepresent it.

This incidental advantage of the separation of the offices is as beneficial to the Commissary as to the public, it enables him to detect the impositions of his servants, and it gives proof and publicity to his own integrity.

# COMPENSATION TO NATIVE ARMY FOR HIGH PRICE OF GRAIN. BAZAARS REGIMENTAL.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE, DATED 2ND NOVEMBER 1821.

I concur generally in the Bazaar Regulations proposed by the Military Board.

The following remarks however occur to me on perusing the draft:—

Regimental bazaars will be very useful to Battalions and Detachments moving from station to station (when bazaars of some sort seem indispensable). They will bring in grain and other articles from the villages near the halting-places, and even carry grain for a few days when the country does not supply it. But as they will employ no capital, they cannot be expected to keep up cattle enough to convey grain for a fortnight's consumption, and still less to make advances to Brinjarries, and procure grain from distant places when it may be more plentiful than near camp.

To do this requires great dealers; such can only be found in general bazaars, and as all this is required when any important movement is undertaken, the superior importance of general bazaars is apparent. It is probably this consideration that has induced the Military Board to confine the drawback to general bazaars. This distinction will probably prevent the regimental bazaars from ever flourishing, but it is impossible for both to flourish, for if each Battalion and its followers makes its purchases at its own bazaar, there will not be many left to deal with the general bazaar.

Even the general bazaar, however, can only be useful in countries that are tolerably plentiful and in some degree quiet. In jungles, during a famine, or when a country is overrun by an enemy or exhausted by the long continued presence of armies, it is evident that other means must be adopted to provide for the timely importation of grain.

For this purpose it seems absolutely necessary to employ Brinjarries (notwithstanding their excesses, which have not been

at all exaggerated), and as the Commissariat and Bazaar Departments are separate, it is a question well worth the consideration of the Military Board, to which the management of this great charge should be entrusted. The memorandum of the Madras Commissary General, forwarded to the Board by Mr. Simson on the 17th of July 1820, furnishes much information on that subject.

With regard to the drawback to be granted to fixed dealers, it would be useful to limit that benefit to articles likely to be consumed within the camp, and even to put some bounds to the quantity, as otherwise the camp bazaar would draw off the custom of the neighbouring town, and the dealers, instead of moving with the troops, would turn their chief attention to supply the inhabitants. It might perhaps be useful, instead of this last rule, or in aid of it, to make all goods exported from camp or cantonments pay duties. The drawback in cantonments should cease the moment the troops move out of them, to make it the interest of the dealers to accompany the camp.

To encourage the dealers to keep cattle, grazing grounds should be afforded to them gratis, wherever it can be done without very great inconvenience.

In examining the articles of the present regulation, the first that requires remark is Section 2, Article 6, where it seems doubtful whether obliging the inhabitants to report their sales to the Chowdry may not be a discouragement to their frequenting the bazaars.

In Section 2, Article 10, it would be better to define the fees, or to direct that the Commanding Officer should in each case ascertain the local usage and fix the fees, which should be publicly notified.

Section 2, Article 11. It would probably be expedient to oblige European sutlers to enter into engagements previously to their sutling in the bazaar, subjecting them in pecuniary matters to the judgment of a court martial, and binding them to pay a certain fine for every instance in which they may infringe the regulations regarding liquor.

Section 3, Article 1. It seems desirable to introduce into this article some explanation of the sort of Price Current expected to be kept; so far at least as to explain that it is only to be a record of prices actually paid, and to prevent the Superintendent supposing himself entitled to fix beforehand the prices at which articles are to be sold.

Section 3, Article 2. It would probably be better to declare that the Superintendent of Bazaars is expected to receive complaints at all times besides these regular sittings. When there is a separate Superintendent in particular, it is not apparent why he should not sit every day, as he has no other duty.

Section 3, Article 6. It is customary in Bengal to have a quarterly examination of the state of the bazaars by a Committee, which is probably useful in directing attention to the abuses or neglects that might spring up in such an establishment.

Section 4. The rules for the Polico in this section are inconsistent with the existing Regulations. They, however, appear to me to be judicious, and I think a new Regulation should be drawn out in conformity to them. For this purpose instructions should be sent to the Regulation Committee, and the Military Board might be requested to depute one of their members to concert the proposed regulation with the Committee. The same opportunity might be taken to consider whether the powers of Court Martial or of Punchayets under Military authority should not be extended as in Bengal and at Madras, and likewise whether the sale of spirituous liquor to European troops, and generally smuggling liquors into camps, should not be made penal, as at Madras.

Our present Regulation regarding the Police of Military cantonments, was copied from the Bengal Regulation III. of 1809. That Regulation was altered by Regulation XX. of 1810, but the alteration has either accidentally or deliberately been omitted here, and it is that which it is now proposed to introduce. It has lately been adopted at Madras with some additions which are worthy of attention. The Regulation which I enclose should therefore I

think be sent to the Military Board, to consult in communication with the Regulation Committee.

That Regulation will extend the powers now proposed for the Military tribunals in some instances, but it will limit them in others, especially that of punishing all crimes not capital. The powers it does confer are not more than seem to me necessary to form the Military bazar into a separate community, exclusively connected with the camp to which it belongs.

Section 4, Article 7. It is not specified how the heads of departments are to control their own followers, though, if it is intended to invest them with any powers, it must be done by regulation, as enacted in the 53 of George 3, Chapter 155, Clause 96, Section 4, Article 12. The orders of the Court of Directors are I believe very severe, in which case they had better be mentioned more fully.

The present opportunity may be taken to repeat and enforce the orders against pressing coolies or taking supplies by force. The Regulation to be passed should also contain some effectual means for checking those abuses, and should also, as in Bengal, contain a clause for the protection of ancient or religious buildings from dilapidation or from being occupied as quarters.

Section 5. On this section I have only to suggest that smuggling be rendered punishable in troops or registered followers by Court Martial, and in other persons by the Magistrates. The contract ought to be in the hands of persons entirely unconnected with those who farm the liquor contract of the surrounding country, to prevent connivance; and for the same purposes liquor seized should be the property of the informer rather than of the contractor, to whom it is given by the Madras Regulations.

It might be an additional check on the sale of liquor to Europeans, to make the native purchasers drink it at the shop.

To assist the Military Board and the Regulation Committee in considering this subject, I annox the correspondence which has passed on it at Madras, and beg it may be returned to me when no longer wanted.

Adverting to the letter of General Smith, to which the attention of Government has been called by the Military Board, I regret to observe, that the style of that Despatch is by no means calculated to give weight to the opinion it conveys. General Smith's communication contains much information of value; but I concur with the Military Board in considering the manner in which they are brought forward is unfavorable to the dispassionate examination of the subject, and particularly unsuitable in addressing a Board of which His Excellency the Commander in Chief is President.

A copy of this Minute should be sent to His Excellency the Commander in Chief, who should be requested to give his opinion on it.

# COMPENSATION TO NATIVE ARMY FOR HIGH PRICE OF GRAIN.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

I still think there should be a separate scarcity price for each of the three kinds of grain, and not an average one for all three, as proposed by the Auditor General.

The inequality he alludes to from the Madras troops in such a station as Sholapore receiving compensation on rice will no doubt exist; but it would do so equally on the system he proposes.

With regard to making the scarcity price different in garrison and in the field, the only consideration which prevents my adopting the opinion of the Adjutant General is, that the sepoys will take the field with more reluctance if they lose any of the advantages of a garrison station by it. I should wish however to know the probable difference of expense to the public on the whole Army, from adopting the plan proposed by Colonel Leighton, and that of making the scarcity price the same in field and garrison. I wish the Auditor General to be called on to furnish at his earliest con-

venience a statement of this nature, and likewise a statement of the expense which will be saved to the public by doing away the field allowances in the Deccan.

MOUNTSTUART ELPHINSTONE.

## COMPENSATION TO NATIVE ARMY FOR HIGH PRICE OF GRAIN.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The difference of the two plans seems to be about a lac of Rupees, and altogether the advantages are very nearly balanced; but as it will be easy to increase hereafter if necessary, and as it is always difficult to reduce, it will be best to begin on the least expensive plan, and make the rate on field allowances less favourable than in garrison. The expense will still be about 2 lacs of Rupees. I cannot at once say what will be the total saving on the arrangement, as the Auditor General's calculation is made on the supposition that the reduction of field allowances in the Deckan is to extend to all the troops in that province. I conjecture that it will be about 6 lacs. If this opinion meet the concurrence of the Board, it may be adopted at once, and field allowances ordered to cease from the 1st of March.

Very great care must be taken in drawing up the order, to discriminate between the cases where field allowances are done away and those where they are still kept up; of the latter description, none seem to me, except the troops at Sholapoor and that part of the staff which would be obliged to move if the Sholapore detachment moved, this seems only to apply to the General Officer and his immediate staff; but His Excellency the Commander in Chief will be best able the point out the exact individuals. Former Minutes should also be referred to. Of the offices made doubtful by the Auditor, and marked in red ink, the Surveyors should receive field allowances or otherwise, according to what may be the pratice in Guzerat. The Commandant of Artillery and his Brigade.

Major must be decided on agreeably to the principles determined on about a twelve month ago. The Inspector of Hill Forts and Captain Rigby may retain their field allowances, as must Major Staunton by the terms of his appointment.

General Smith may be consulted about the expediency of reducing any of the Contingent Charges. Military Pay Masters, Post Masters, Brigade Majors, &c. at the fixed stations must go on garrison allowances. I doubt whether the Native Commandants ought, as I am uncertain what other allowance they possess, and it ought to be made a comfortable situation for a deserving old Native Officer. His Excellency the Commander in Chief I remark will probably settle most of these uncertain points.

MOUNTSTUART ELPHINSTONE.

### LAWS AND REGULATIONS.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE, DATED THE 10TH AUGUST 1823.

I made no remark on this despatch when I first circulated it, because, after examining all the Acts of Parliament, I thought the subject involved in difficulties which none but a professional man could remove. At the same time, as I had no doubt of our possessing the same right to make the disputed Regulation that we possess to make any other Regulation for the general government of the Company's territories, I would have preferred letting the subject sleep altogether, were it not that it would appear a culpable neglect to omit to examine a doubt pointed out to us by our legal adviser on so important a question.

The difficulties I allude to are the following:-

The only express authority the Company's Governments possess to make laws, is derived from the 13 George III. 63, 36. By that enactment the Governor General is empowered to make Regulations for the Civil Government of the Settlement of Fort

William and the factories and places subordinate or to be subordinate thereto; but these Regulations must be approved by the Supreme Court; they must not be repugnant to the laws of England; and they must impose no penalty higher than fine and forfeiture.

This I say is the only express authority given to the Company's Governments to make laws. Of the other Acts quoted by Mr. Warden and Mr. Goodwin, 21 George III. 70, 23 only empowers the Government to make Regulation for the Courts, and evidently means only for the process of the Courts, by the proviso that they shall not produce additional expense to the suitors; a clause that would never have been inserted had the Act been meant to convey power to take away a man's life, or alter the laws under which he held his property.

37 George III. 142, 8 enjoins the formation of the Regulations already passed into a Code, but gives no new power to pass Regulations, and contains no express acknowledgment that the Regulations said to have been passed had not been passed according to the forms, and under the restrictions enjoined by the Act of the 13 George III.

39 and 40 George III. 79, 18 extends the penalties which the Indian Governments are empowered to impose to whipping.

47 George III. 68, 3 extends the 21 George III. 70, 23 to Bombay, but expressly subject to the Regulations, provisions, and confirmations required in Bengal.

53 George III. contains nothing on the subject.

As far as the letter of the law goes, therefore, the Advocate General is in the right, and we have no legal power either to make the Regulation concerning material law, or any other Regulation for the Government of the country.

But, on the other hand, it is probable that when the Act of 13 George III. was drawn up, the framers did not know that we had taken on ourselves the Government of Bengal, or that we possessed any territory in India, and consequently is is probable they only meant to refer to our trading settlements on the sea coast. We assumed the Government of Bengal in August 1772, and this bill was brought in in May 1773.

It is also well known, that some years before the passing of the 37 George III., a number of Regulations had been issued and formed into a Code, without the approval of the Supreme Court; some of them imposing capital and other punishments, and others entirely repugnant to the laws of England, and although it is nowhere expressed, it may clearly be inferred that these are the identical Regulations alluded to in the Act, which consequently recognizes the right of the Indian Governments to make laws; not in virtue of any specific Act of Parliament, but of the sovereign power transferred to them by the Native Princes under the authority of the British Legislature.

For these reasons, I have not myself any doubt of our power to pass the Regulation in dispute; but as it is known to be very unsafe for any man not regularly educated to pretend to understand a law, I still recommend the reference suggested by the Advocate General.

MOUNTSTUART ELPHINSTONE.

## LAWS AND REGULATIONS.

#### MINUTE BY THE HONORAPLE MOUNTSTUART ELPHINSTONE.

I imagine the Regulation was resolved on before His Excellency the Commander in Chief's arrival in India; at least I do not remember its being discussed since I came to Bombay. It is a mere transcript of a Bengal Regulation, and as it has long been, in force there, and cannot be altered without a great deal of reference and discussion, I think it had better be put as it stands into the new Code. Major Kennedy's doubts however, as well as Mr. Norton's, should be referred to the other Presidencies.

## ESTABLISHMENT, GUN CARRIAGE MANUFACTORY.

### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE, DATED 24TH MARCH 1824.

There are only a few observations which I shall offer now. I agree with Mr. Warden, that there is not at present the smallest occasion to advert to the future wants of His Majesty's Squadron, but I cannot agree that a Gun Carriage Manufactory can be much lower in peace than in war. There is no time during an Indian war for making Gun Carriages, and still less for sending them from the Presidency. They must all be kept ready in the field Arsenals, to wait the breaking out of future war. After a war there may be a temporary period of exertion to replace the wear and tear of the war; but I should not think any of the present permanent establishment was raised during that period. With regard to Bengal, I cannot help suspecting some accidental omission. The Gun Carriage establishment at Cossipore, near Calcutta, used to be on a considerable scale, and there is another still more considerable one I believe in the Upper Provinces at Futtyghur.

MOUNTSTUART ELPHINSTONE.

## HORSE DEPOT.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE, DATED 29TH APRIL 1824.

I think Mr. DeVitre's letter had better go to the Military Board before we enter on the question of establishing a depôt for yearlings. I confess I should not myself recommend such an establishment, unless it has been found to answer on trial in Bengal or at Madras. Judging on general grounds alone, I should think it would be expensive, and that it would be difficult to judge at the age of one year how a colt would turn out.

## HORSE BREEDING.

### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The public is much indebted to Mr. Warden for this plan, and I cannot agree with him that it ought to be abandoned without a much longer trial. It has only been tried four years on any general plan, the previous arrangement in Guzerat being only on a very limited scale, and it would take at least twice as long to see the good effects of it even if it had not been impeded by an accidental cause, the bad judgment of the Committees and consequent bad choice of stallions.

Under a Native Government of the extent of ours in India, there would be a demand for at least 3,00,000 Military horses, and some of them would be sought for at immense prices; while the state of breeding was at all proportioned to this sort of demand, we found no great difficulty in selecting horses for our Cavalry. though not one horse in 20 perhaps would answer our purpose. Now, when that demand is entirely gone, it is evident that unless we do something for ourselves, we shall soon be left without the means of mounting our Cavalry at all. The Government of Bengal trusted partly to some injudicious attempts in their own provisions, but chiefly to the chance of purchasing horses on the west of the The first never answered, and the second failed so com-Jumna. pletely, that upon the end of the last war the Bengal Cavalry was almost dismounted. Since then the effects of an improved system have been felt, and the annual remount is nearly supplied by the Company's own breed. Before we change our system, we had better refer to Bengal for information. Private dealers cannot be expected to improve a breed by importing Arabian and European sires.

## ESTABLISHMENTS, COMMISSARIAT.

¥

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE, 8TH MARCH 1825.

Although the expression in the Commissariat Regulations, which directs the Commissary General "to regulate the fixed and extra establishment of the different divisions," appears at first sight to justify the adoption of a measure like the present by the Commissary General on his own authority, yet a short consideration of the nature of that Officer's duties, shows that he ought to have confined himself to a representation to Government.

It is the duty of the Commissary General to ascertain the extent of the resources of each Division of the country, and to discover the most economical means by which the demands of the public service can be supplied in each; but it must rest with the Government to decide on the proportion of troops which ought to be kept in readiness for immediate movement, on which the extent of the field establishment to be kept up must depend.

From this it is evident that the Commissary General ought to make no reduction of his own authority, but ought in all cases to pursue the established course, of referring his proposed proceedings through the Military Board to Government.

The above remarks by no means imply that it is not the duty of the Commissary General to point out cases where establishments might be maintained at cheaper rates than those actually in existence, or where they might be entirely dispensed with from the ease and certainty with which they could at any time be replaced from the usual resources of the country; they only point out the necessity of a reference to Government where it might be influenced by political considerations to adopt a course not recommended by economy.

From these principles it follows that the Commissary General ought not to have addressed his letter of the 5th February to Major General Sir L. Smith, but to the Military Board. From the language of the Regulation above quoted however, as well as from

٠, ٠

the manner in which he submitted his suggestions to the consideration of Sir L. Smith, the Governor in Council considers the Commissary General to be entirely exempt from all blame in this deviation from form, and is sensible that his proceeding originated solely in his anxiety to promote the important public interests committed to his charge.

In consequence of the peculiar state of the conquered territory in the Deccan arising from the unfavorable season and of the disturbances to which the present want of subsistence is likely to give rise, the field establishments should be restored to their former footing, and this resolution, with the reasons of it, should be communicated to the Commissary General. It is indeed to be regretted that Sir L. Smith should now feel himself called on to reduce them in consequence of the suggestions submitted to him.

It is almost unnecessary to observe, that the periodical tours of the Commissary General for the regulation of establishments forming part of the fixed Regulations of his department, are not in the least connected with any distrust of Major General Sir L. Smith, or any doubt of a continuance of his zealous attention to the reduction of all unnecessary expenses connected with his command.

Should this Minute be concurred in, it might be drafted into a letter to His Excellency the Commander in Chief.

## MOUNTSTUART ELPHINSTONE.

## FIELD ESTABLISHMENTS, DECCAN.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

I kept this back, wishing to have the advantage of the observations of His Excellency the Commander in Chief, whose opinion I believe differs from my own on this subject.

In our former discussions regarding the Deccan Field Establishments, I believe it was always intended to get rid of the camels,

although the impossibility of selling them led to a resolution that they should be allowed to die away. The only question is, whether the present bad season is likely to last so long, or to be attended with such disturbance as to render it necessary to alter our former views. I should not myself think that it was, and as a considerable number of camels which the Commissioner purchased in a moment of urgency have now been made over to the Commissariat, I do not think any further addition to that establishment should be made.

#### MOUNTSTUART ELPHINSTONE.

#### REGULATIONS.

MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

There are two separate subjects for decision, as the Chief Secretary observes.

The first regards the subjects of foreign states who are serving as camp followers; and it was in respect to them that I recommended on the back of His Excellency the Commander in Chief's last letter, that we sould follow the practice of Bengal. practice, it seems, is to treat such followers in the same manner as if they were our subjects, and to make no separate Regulations regarding them. If there be no great objection to this way of proceeding, it has the advantage of being simple and conformable to our own usage, as well as to that of the Natives. If we attempt to be more regular, we shall fall into considerable difficulties. We profess to derive our power to punish the persons in question from the Native Princes. Ought not the Regulation to be made by them or in their name? or if we wish to act as their delegates in legislation, do not we require a more perfect delegation? At present the Sunnuds empower the Commander in Chief in some instances, and the Commanding Officer of the subsidiary force in others, to proceed against the subjects of the Native Prince according to our customs. I doubt if any of the Sunnuds give this

Government power to make regulations expressly for any portion of the subjects of those princes. I think the Commander in Chief, or the Officer in whose name the Sunnud is made out, would be much safer in acting under it on behalf of the Native Government, than if he attempted to derive an authority from any regulations of ours.

The second question relates to the necessity of another regulation for the trial of rebels and insurgents by Court Martial, and on the propriety of having a form of warrant ready in case of Martial Law being again proclaimed.

I am not convinced of the necessity of another regulation. The present one has been thought sufficient hitherto, and probably is so. It was first passed at Madras (VII. of 1808) by Sir George Barlow, who drew up the Bengal Code. It was adopted in Bengal in 1818 by Lord Hastings, who was familiar with Military law, and it was introduced here (probably not entirely without consider ation) in Sir Evan Nepean's time, though it did not return from Bengal till after he was gone. It has been repeatedly laid before the authorities at home, (including Parliament, I believe,) and has nover been objected to. I cannot therefore but think the doubts entertained of its legality must originate in some misapprehension. I even think (though not so decidedly) that the belief of its requiring additions is probably mistaken, but to these additions I consented. I only objected to the additional regulation being applied to the Deckan. In that country I maintain that we have the same right which the Paishwa had, of resorting to Military tribunals whenever we think it expedient, and that a regulation would weaken our powers instead of strengthening them.

With respect to the Warrant, my own opinion is, that Colonel Pierce's scruples were groundless, and that the Warrant he demanded (which led to all this discussion) was unnecessary. I found my opinion on the knowledge that the Madras Government, to which Colonel Pierce belonged, has nover issued a warrant in all the many cases where it has proclaimed Martial Law, a letter from the Secretary being deemed authority enough. The same seems by the Chief Secretary's note to have always been the ease here, and it probably always was in Bengal, as I find Lord

Wellesley acting on it, in one case at least. It is true that no precedent can set aside a statute, but I have not yet seen any statute that requires a Warrant. The Mutiny Act applies to other countries and to another description of men. I have nevertheless acquiesced in the propriety of Warrants, both on a former occasion and in my remarks on the Chief Secretary's note. I think the Regulation and the Warrant both unnecessary, but I agree to them in deference to our legal authorities. The Regulation, as applied to the Deckan, I think not only unnecessary, but injurious, and I therefore object to it as far as that country is concerned.

MOUNTSTUART ELPHINSTONE.

## PENSIONS.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

I am always unwilling to overrule the decisions of Boards ontrusted with the details of the Service, and in this case I do not think it required. All the argument in the former resolution is against pensioning widows of men who, though nominally on Field service, are really not more exposed to danger than if they were at Bombay; but a camp is a much more dangerous place for the cholera than a cantonment, and it seems certain, that if these men had not gone on this service, they would not have died.

MOUNTSTUART ELPHINSTONE.

## PENSIONS.

### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

After the remarks of Mr. Goodwin and Mr. Sparrow, I have only to remark, that I should never propose the pensioning of families merely because they had died on service. If a Sepoy is killed, his family should be pensioned as a matter of course; if he dies in the ordinary course of nature, it ought not to be pensioned at all; but if he dies on service from any peculiar malady arising

from his employment, it should be a point for special decision whether his family should be pensioned or not.

## MOUNTSTUART ELPHINSTONE.

## PENSIONS.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The Cholera Morbus is a most violent, and it is to be hoped only a temporary, scourge. It prevails in particular places while the rest of the country is exempt from it; it rages with peculiar fury in camps and among persons exposed to night air, to wet, and to the other vicissitudes incident to Military service. A man ordered into a situation of so much increased danger, seems entitled to consideration; but the case of each detachment requires to be considered, and no general rule will apply.

I doubt if Mr. Warden is correctly informed, when he states that the sepoys get a gratuity for entering the Service and another for leaving it. I believe the only case in which a sepoy gets a gratuity, is when he becomes unfit for the Service, and is obliged to leave it against his will. The whole proceeding will of course be laid before the Honorable the Court of Directors.

## MOUNTSTUART ELPHINSTONE.

## PENDAL SYSTEM.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The papers now forwarded show the expense of the Pendal system, calculated on more correct principles than in the former correspondence.

2. The Chief Engineer calculates the immediate outlay in providing pendals at the stations enumerated in his letter, for 15 Regiments only, at Rupees 5,62,000; but as it is most probable, that if the introduction of pendals be so far sanctioned, it will

ultimately be extended to other stations, it will be as well to calculate the expense for the whole Native Army.

3. The number of Native corps, not including locals, Pioneers, &c. may be stated as follows:—

3 Regiments of Native Cavalry.

26 ditto ditto Infantry.

1 Marine ditto Battalion.

2 Extra ditto ditto.

1 Golundauze ditto ditto.

1 Guzerat Provincial ditto.

34 Total.

4. Of the above, pendals are already provided as follows, viz:—

2 Surat.

2 Bombay.

1 Baroda.

1 Bhewndy.

6

Leaving 28 Regiments to be provided for.

5. The pendals already erected experimentally for one Regiment at Baroda cost Rupees 20,478; the estimates now before Government for accommodating another Regiment at the same station, is Rupees 44,000; with this exception, the Chief Engineer, in his estimate, calculates the average expense of pendals for all the Regiments at Rupees 37,000 each. On this calculation the expense of providing pendals for 28 Regiments would be Rupees 11,36,000

The interest on the above at 6 per cent.

would be a permanent charge per annum of..., 68,160

The annual expense of repairs for each

Regiment is estimated at 800 Rupees, or for 28,

As the troops in pendals still continue to draw half hutting allowance, the expense for 28 Regiments at Rs. 1,230 biennially, would be approally

be annually ... ... ... , 17,220

Making an annual charge of Rupees 1,07,780 in addition to the first outlay.

- 6. On this ground, independent of the opinions entertained by a great portion of Military men unfavourable to the pendal system, I would recommend that the former negative against their introduction generally be confirmed, and that each case, as brought forward, be considered on its own special grounds.
- 7. Local circumstances may have rendered them desirable at Bombay and Surat, and also at Bhewndy; but there can be little doubt that, in a plurality of cases, the hutting system is more suited and acceptable to the Native troops.
- 8. On the same grounds I would recommend that the estimate now before the Board for erecting pendals for the troops in Cutch and for another Battalion at Baroda be not sanctioned.

MOUNTSTUART ELPHINSTONE.

## PENDAL SYSTEM.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

I entirely agree with His Excellency the Commander in Chief, in thinking that the general use of pendals should not be introduced without the fullest consideration. There would be nothing in the procedings of Government inconsistent with our acting on this opinion, if the last letter from the Secretary in the Military Department to the Private Secretary of His Excellency the Commander in Chief, dated 19th June 1866, had not gone a little beyond the Minute on which it was founded, by declaring that the Governor in Council would be prepared to sanction the gradual introduction of pendals, while the intention of the Board was, that it would be prepared to consider each case separately.

My own opinion is, that the system had better not be allowed to slide in gradually, but should be examined, with a view both to the expense and general expediency, and adopted or rejected on general grounds.

## MILITARY DISCIPLINE.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The question cannot be satisfactorily put at rest without a reference to the Supreme Government, but as the conduct of Captains Livingstone and Fredrick does not depend on this decision, it should (at the same time that it is intimated that the above question is under consideration) be communicated, that the Governor in Council disapproves of the manner in which those Officers protested against the orders of the General Officer Commanding the Forces.

Had they doubted their liability as Officers of the Garrison Staff to be put on Committees by the Officer Commanding the Forces, they should either have referred to the Commander in Chief of the Garrison in the first instance, or, if time did not admit, to have attended, and afterwards requested instructions for their future guidance. Having attended the Committee, they were not at liberty, on a question arising out of that duty, to refer to their situation as Officers of the Garrison Staff. It was their duty to obey the orders they received, and they were at liberty to have afterwards submitted a respectful statement of what they considered to be their rights. The Governor in Council however is persuaded, that the mode of protest which they adopted, did not proceed from any disrespect to the high authority under which they were acting, but to an erroneous impression of what was due to their Commissions.

MOUNTSTUART ELPHINSTONE.

## HORSE BREEDING.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

It has long been my intention to propose to the Board, that more effectual means should be adopted for encouraging the breed of horses in our own country, especially in the Deckan, and since my arrival here, I have been more than ever impressed with the importance of the measure.

The plan originally suggested by Mr. Warden, for distributing stallions throughout the country, still appears to me the best; but to perfect it, evidently requires more attention than the Collectors can give it; and it also requires that the person employed to superintend the breeding of horses, should likewise be empowered to purchase them, or send them to Committees for purchase; a good market being a better encouragement than any prizes, though those also, I am of opinion, should still be continued. The Superintendent should be in charge of the stallions, both in Kattywar and the Deckan, and might be authorized to place them wherever he thought the country favourable. The Collectors and other authorities being ordered to afford him every assistance.

The present opportunity is particularly favourable, as the Cavalry are complete in horses, and time will be afforded for breeding and for seeking out the proper persons to employ and encourage, before we are again pressed for an immediate supply, for although the breeds of the Deckan and Kattywar were at a recent period so excellent, they are now reduced so low, that I by no means feel confident in their immediately answering the demand; and I would suggest that the appointment in Persia should still be kept up for a few months, until we are enabled to pronounce on the probability of our succeeding in mounting the Cavalry here; a point on which the Superintendent should report as soon as possible.

The allowances should be the same as those now held by the Agent in Persia, and the appointment should be vacated on promotion to Lieutenant Colonel.

I know no fitter officer to propose for the duty than Captain Jameson, who was recommended to me for the employment by the late Commander in Chief; and if His Excellency the Commander in Chief can spare his services, I would suggest his immediately taking charge, and proceeding without delay to prepare rules for the conduct of his department, which should be submitted to the Military Board for consideration.

Before laying this Minute before the Board, I beg to be favoured with the opinion of His Excellency the Commander in Chief on a point of so much importance to the Army.

29th September 1826. MOUNTSTUART ELPHINSTONE.

## HORSE BREEDING.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The plan having succeeded perfectly at the other Presidencies which were not before breeding countries, I cannot see why it should not succeed in Cutch, Kattywar, and Maun Dais, which were always celebrated for the best horses in India. It has failed, because no one person had an interest in its success. Committees appointed by chance brought bad stallions, and Collectors, fully occupied with their own business, and not always skilful in breeding, were quite incapable of superintending the experiment. Had the plan been tried in Bengal on the same system, no doubt it would have failed there too.

With regard to the other objection, I have not failed to consult. His Excellency the Commander in Chief (as ordered by the Court of Drectors), whether an Officer can be spared, and His Excellency may again be consulted as to the relative importance of the employment for an officer (with his Regiment or superintending the breeding of horses). I must however observe, that if the plan promises to answer, the Agent of Persia will be withdrawn from thence, and the number of officers with their Regiments will not be diminished.

MOUNTSTUART ELPHINSTONE.

## HORSE BREEDING.

MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

Having understood from Captain Jameson that one great cause of the ill success of the breeding system has been the bad-

ness of the stallions, a fact confirmed by all the Collectors, and to be anticipated from the manner in which committees are generally constituted, I would recommend that Captain Jameson be authorized to cast all stallions which are useless for breeding, and that hereafter none be sent to Committees unless recommended by him.

#### MOUNTSTUART ELPHINSTONE.

### REDUCTIONS.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The Minute of the Commander in Chief does not call for any new remark from me, except that I concur in His Excellency's proposal for retaining the two extra Battalions, and covering the expense by a reduction in the numerical strength of the other Regiments. The proposed arrangement, however, will effect no part of the saving, which Mr. Warden has estimated at 4,21,260 Rupees. It will, on the contrary, create additional expense if care is not taken to reduce men enough from the other Regiments to cover the pay of the Officers as well as that of the men.

I should also be happy to concur in Mr. Goodwin's proposal for sending the whole of the European Regiment to Cutch, if it could be done without expense. In every other respect I consider it as a most desirable arrangement; but as the principal employment of the troops in that country is to make rapid movements from time to time after banditti, I really do not think we can dispense with their being in that state of constant preparation, which renders field allowance necessary.

There are several subjects which His Excellency the Commander in Chief has not himself discussed, but on which he proposes a reference to the Military Board. That however appears to me to be attended with some difficulties. It must be recollected, that such a reference goes in the name of the whole Board, and implies the concurrence of the whole in the necessity for explanation. It must also be remembered, that in present circumstances such a reference implies censure. The Military Board has just gone

through a careful scrutiny of all the departments under them, and have made their report (in my opinion a judicious one) on the possible reductions. If we within a month send to them a plan differing from theirs, will it not appear that we are dissatisfied with their proceedings.

I have not their report to refer to, but I remember enough of it to illustrate what I have observed.

In the Gun Carriage Department, the Military Board proposed that the extra work should be done by the Commissariat. This they thought would lessen the expense of the Gun Carriage Manufactory by 150,000, while they reckoned that such extra work as would now be required, would only cost the Commissariat 100,000, thus leaving a clear saving of 50,000 Rs. I confess I have some doubts whether this will be anything but a transfer of a charge from one Department to another, but at all events I think the Military Board have given full credit for any saving that can be made, yet Mr. Warden's plan supposes a saving of 150,000 as under this head, and by referring the question to the Board, we should lead them to think that the whole Government concurred in the opinion.

The next point is the Ordnance, which seems to have been minutely examined by the Military Board, and in the different branches of Conductors and Store and Tent Lascars, they have already made such reductions as they thought practicable. I do not know whether those were more or less than the sum proposed by Mr. Warden, but it is probable they were not fixed without some inquiry, and it would not show much confidence in the Military Board, immediately to propose something different from what they had settled. I do not mean to say that it might not be highly proper for us to show such a want of confidence in particular cases, but before we do it, we should have some ground for thinking that the new plan is really better adapted to the wants of the Service than that which it is proposed to be set aside.

The other Ordnance savings proposed by Mr. Warden rest entirely on the supposition that our establishments should be smaller during peace than war (although our forts and stations have more than doubled since the last war), which scarcely seems sufficient ground for questioning the correctness of the late proceedings of the Military Board. A mere glance at the establishments of the Ordnance Department, will show how little they have to do with actual war. As an average establishment we may take—

- 1 Laboratory man.
- 2 Carpenters,
- 1 Sawyer.
- 1 Armourer.
- 2 Smiths.
- 1 Bellow's boy.
- 1 Hammer man.
- 1 Sikligar.
- 1 Bheastee.
- 1 Sailmaker.
- 2 Workers in leather.

This is an establishment to keep a few arms, stores, and tents in repair, to to get up equipments for whole armies. They could only be dispensed with at some stations, if a plan recommended by Mr. Warden in another place were adopted, of having nothing but some muskets and some musket ammunition at the distant stations, depending on the Presidency, and perhaps one or two other Grand Arsenals for all other arms and stores.

This I do not think possible; but the number of stations might possibly be diminished, especially in Guzerat. If His Excellency the Commander in Chief should think this likely to be practicable, the opinion of the Military Board might be taken regarding it.

Nor have I any objection whatever to the Military Board being requested to explain the fluctuations in the expenditure of stores adverted to in paragraph 35. It is asked in the same paragraph, what the Ordnance Department can have to do during peace; but if any one will wade through one quarterly statement of the receipts and issues of the Grand Arsenal, he will soon perceive that there is no want of employment in that department.

The next item, not adverted to by His Excellency the Commander in Chief (perhaps as being connected with the Military Board), is the Establishment of Engineers. The first objection to the present plan is, that the expenditure of each district is too little to require an officer to superintend it. If the only duty of an Officer were to superintend the accounts of expenditure, the whole work might perhaps be done at one desk, but as he has to examine every building that is creeting or repairing, and often to report on plans where no building ensues, it is necessary to consider how the works under him are situated, as well as what they cost. cannot be a more striking illustration of this than the Northern Districts. We have lately abolished one Engineer, and Mr. Warden thinks one more should be abolished in the same range, while a letter in yesterday's box shows, that it is only by an inconvenient removal of the Engineer of the Baroda Subsidiary Force to a central position out of the Gykavar's territories, that even the late reduction can be carried into effect.

The next objection is to the Superintending Engineers; this was proposed by the late Commander in Chief, and agreed to by the Board as tending to economy. We ought to be convinced that the plan has failed before we abolish it with the very same view with which we lately founded it. I do not suppose it will ever be maintained that a reduction of the establishments which control expenditure is necessarily a real saving.

The next department belonging to the Military Board is buildings, in which are included fortifications, churches, barracks, pendals, hospitals, and jails; under these heads we have expended for 5 years at the rate of 13 lacks of rupces a year, out of which it is proposed that we should in future save ten. Much we no doubt shall save, and the Military Board have pointed out all that we can do to promote the object, which is, to be slow in sanctioning public works; but for what purpose can we refer on this subject to the Military Board. The only particular buildings specified as objectionably expensive, are hospitals and Regimental schools; on the necesity of the greatest comfort in the first the opinion of the Military Board could not make us alter our own, and the schools

we have long since been obliged to give up among many other desirable arrangements which the pressure of the times renders inexpedient.

In comparing charges for fortifications and buildings at different Presidencies, the first point is, to be sure that both heads comprise the same items, which is most probably not the case. The next, is to see if the circumstances are the same. New jails are not wanted in old zillahs, nor new churches at old stations. From what we see at Mhow, the chance is, that the Government of Bengal, wherever it gained a new territory, built costly but premanent buildings, which rendered all future repairs unnecessary, while our very economy has protracted our expenditure to the ninth year since our acquisition of the country.

The next head is pensions, and there I see no reason to suspect the Military Board of remissness.

In the case dwelt on by Mr. Warden, I think they were quite right. Mr. Warden remarks, that the ryots are as valuable as the sepoys, and inquires why we should not pension their families when they die of cholera, to which the answer is contained in the rule on which the Military Board has acted. It is not sepoys who die of cholera whose families are pensioned, but sepoys who die of cholera in consequence of employment on service. Were ryots commanded to move into infected districts and expose themselves to the weather on public duty, their families ought also to be pensioned if they died.

I think however, that it would set the question of the merits or demerits of the Military Board at rest, if the Auditor General were requested to explain, as early as he might find practicable, the causes of the increase of the expense of pensions in late years. I think I can suggest two of them. Ten years ago we had only 18 Battalions. We have now of Cavalry and Infantry 29 Regiments, besides 2 extra Battalions and the Golandauze, in all nearly double our former force. This must nearly double our pensioners. In the ten years preceding the above periods, the Bombay Army lost apwards of 10,000 men by desertion at different times. This

might be either cause or effect of the paucity of pensions; but it certainly took many pensioners off our hands. We have now no more desertions than other Native armies.

I do not know what the practice is at the other Presidencies with respect to gratuities. When they recruit from a distance, I think they ought to give gratuities as we do. To go on to the heads, of expense in paragraph 61, I believe the two plans recommended for saving in the transport of stores have always been acted on.

I have already given my sentiments on the exchange paid to the troops.

The carriage of the sick was some time since revised and greatly reduced, I should think as much as was practicable.

If paragraph 66 is meant to recommend an abolition of the Commissariat, I would not recommend its being made a question with the Military Board. The objections to such a measure seem to me insuperable.

The grounds on which the bazaars on the Bombay establishment were established on their present footing, were explained both by the Government and by the different members of the Military Board at unusual length, to those papers I must beg to refer.

I am very sorry that I have been obliged to dissent from so many of Mr. Warden's propositions on a subject on which I believe we are both equally interested. If the Minute under discussion had been confined to plans of future reduction, this might not perhaps have been the case; but as it is professedly written to show the grounds on which Mr. Warden differed on former occasions from the other members of the Government, the answer could scarcely be otherwise than to a certain degree controversial.

#### REDUCTIONS.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE. .

Mr. Warden's Minute of the 3rd has just reached me, and I beg to offer some remarks on parts of it, reserving what I have to say on the Military Department, until I hear the sentiments of His Excellency the Commander in Chief.

The numbers of Sebundees have been very minutely examined in each district, chiefly since May 1826, and after many reductions, an additional retrenchment of their numbers has been made by the Committee, the local corps have undergone a like revision; so that it is probable they are already brought far below the level desired by Mr. Warden. If they could be further diminished, it should still be done by a minute examination. The classes united to form the aggregate of 15,309, comprehend all descriptions of persons, from fully disciplined Battaliens to the worst description of Peons, whose pay is sometimes rather given to prevent their robbing themselves, than from their utility in checking other robbers. Some also, as Mr. Warden observes, are mere Revenue Peons. No conclusion that is come to regarding a part of such a mass can be applicable to the whole.

The resolution of Government, at the recommendation of the Reduction Committee, that regular troops should be employed on no civil duties whatever, except Jail guards and Treasury guards, with the additional inquiries about Jail guards, suggested I believe by Mr. Warden, seem to have sufficiently circumscribed the employment of troops of the line. The advantage of this restriction of their services is so obvious, that I have no recollection of its ever having been called in question.

The management of the Surveys does not appear to me so injudicious. Of General Reynolds' I know nothing, but that it ceased about 20 years ago. The Deckan Survey is on the model of Colonel Lambton's, which has not been reckoned injudicious. Had the establishment been kept up, that Survey would have closed this

year or the next. The Guzerat Survey, though it has cost too much, is not devoid of practical utility, and affords much interesting information. These are the only remaining Surveys, and both have been reduced to a very moderate annual charge.

On the details of the Military expenditure I shall, for the reason before stated, make only a few observations, but I must first remark, that a great number of the proposed reductions have already been completed, that others of the number have been discussed, and that the expediency of most of the remainder, seems doubtful.

If the proportion borne by our Military expenditure to our resources, in comparison with that at the other Presidencies, was the criterion by which we ought to regulate that expenditure, we should have no deficit, but the principle cannot be acted on. Mhow, for example, yields nothing and has 4 Regiments. Broach yields 20 lacs and has 5 companies, yet the force at Mhow is the most necessary of the two.

The supposition that our peace establishment should be less than our war, does not seem to me more defensible. It is founded on the practice of Europe; but in Europe we have neither foreign conquests to keep, nor sudden emergencies to provide for. peace in Europe more than half the Army is discharged, and more than half of all establishments broken up. In no part of India have we ever had a peace which was not followed by an augmentation of the Army, with no diminution (if with no increase) of the establishments, and this must be the case as long as every war adds greatly to our territories. The ordnance which was sufficient for 8 stations cannot be sufficient for 18; the pioneers which might have caused a saving had they been employed on fortification at Bombay, Tanna, or Surat, may cause an expenditure when required to make roads to Poona and to Mhow; the Engineers which do the duty of an old and settled territory, cannot do that of a new one, where every species of building, Civil and Military, is still to be constructed, nor can the expenditure on buildings in two such countries bear any comparison.

Some of these expenses however must diminish as time advances, and we should take care that the reduction of them is not overlooked.

The assumed saving of 10,00,000 Rs. for buildings is nevertheless far beyond my expectations. The whole amount estimated for every description of buildings by the Accountant General is 12,37,000 Rs., supposing the Military dead stock to be all buildings; but as this is probably very far from being the case, the whole estimated charge for buildings probably does not exceed the proposed saving.

I consider the uniformity of the coin established for the pay of the sepoys as one of the greatest improvements that has been made of late years in the Army, and should be very sorry to see it done away.

I should much prefer 3 Regiments for the force in Cutch; it was the necessity of the times alone that led me to recommend reducing it to 2 Regiments.

The reduction of the Batta to the sepoys, while continued to the European Officers, is a measure in which I should be sorry to concur.

As it would appear from Mr. Warden's Minute that he had opposed every expenditure that has been adopted by the Government, and that he had stood alone in his opinion, it is necessary that something should be said on the other side. The great items of charge which had at one time increased our expenditure by more than seventy lacs of Rupees, were enumerated in two papers annexed to my Minute of February 11th, the heads among those charges which were disapproved by Mr. Warden are few and unimportant. It has certainly been my misfortune often to differ from Mr. Warden on questions of expenditure. In those cases I have only to hope that it may be determined, by reference to each case, whether the saving was such as could have been acceded to, and whether if it had, the gain in a vast majority of instances would have made up for the trouble and derangement of the departments affected.

I shall only offer one more observation. Mr. Warden states, that if twenty or even one lac of Rupees can be retrenched from the annual expenditure, it says but little for the control exercised by those under the Government. The articles retrenched are all of conspicuous magnitude, and it will cost the Court of Directors little trouble to see if any of them is of such a nature as to admit of a suspicion that it was incurred through negligence.

MOUNTSTUART ELPHINSTONE.

7th July 1827.

## REDUCTIONS.

### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The Military Board appear to have given the question proposed to them a careful consideration, and I am much inclined to believe in the correctness of their opinions.

But their statement, instead of increasing our savings, will probably diminish those already calculated on. In most of their proposed reductions they have been anticipated by His Excellency the Commander in Chief, and the result of their opinions in those instances rather leads to a doubt whether we have not taken credit for greater diminution of expense than is practicable. From the different forms in which they are drawn up, I have not been able to compare the Commissariat reductions proposed by His Excellency the Commander in Chief with those in the accompanying paper; but the total amount of the latter exceeds that of the other by a lac of Rupees, even if no allowance is made for occasional hired cattle, and by two lacs if that allowance be made. It is possible that His Excellency the Commander in Chief, on looking over the column of charges which the Military Board consider indispensable, may be inclined to restore some of those which he has recommended to be abolished, at all events it seems necessary to make the proposed allowance of a lac of rupees for occasional Commissariat charges if the permanent ones are so much reduced.

The whole net saving in the Ordnance Department, including the Gun Carriage Manufactory, after deducting the saving in Lascars, already proposed by His Excellency the Commander in Chief, amounts to about one lac of rupees, and I am afraid the calculation that the work will be done so much cheaper in the Commissariat, does not stand upon very sure grounds.

If therefore the present report tends to no diminution of the reduction already calculated on, it will lead to no increase, and the reduction in the Military Department remains at 18 lacs.

On the other hand, I think if the Accountant General has taken no credit for a saving in Military buildings in future years, he might calculate on 1,50,000 rupees (as stated by the Board); at least the expense of buildings in new possessions ought to diminish after a certain time, and numerous improvements, which were highly expedient in ordinary times, ought to be suspended in time of remarkable pressure.

## CATTLE BREEDING.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The report of the Military Board, though very meagre, is correct, and ought I think to be communicated as such to the Honorable the Court of Directors. The difference between the opinion of the Board and that of Sir L. Smith, is only in appearance. Sir Lionel appears to have considered the question as put with a view to the introduction of horses, and answers by expressing his good opinion of bullocks. The subsidiary force at Poona also was so long on the field establishment, that the cattle had all the advantage of the permanent system. They were besides foreign cattle. If we wish for any secure system of our own, we must beed like the other Presidencies. I do not propose a plan in detail, because the letters of the Supreme Government have told

us with great truth, that in the present state of our finances no prospect of future advantage can make up for present expense. It could wish, however, that some opinions were obtained on the possibility of improving the general breed of the country by the introduction of foreign bulls. This is a very important object in an agricultural view no less than in a Military.

MOUNTSTUART ELPHINSTONE.

## CATTLE BREEDING.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

I am happy to see our attention called to this subject. There is, as is well known, a beautiful breed of cattle in Guzerat, and if it answers well for work, and can be procured in sufficient numbers, nothing is wanting in that province. On these two questions however I have doubts.

In the Deckan the breed of cattle is useless for Military purposes, so much so, that the Madras Cattle Contractors who came up with the Duke of Wellington, were retained at a great expense as long as there was service in that part of the country, and are still retained I believe on a more contracted scale.

It is always an article in their contract, that a certain proportion of their cattle are to be from Mysore, and it was the advantage of producing this description of cattle that recommended them for employment. This plan answered very well as long as it was kept up, though I believe it is the only instance on which depending on hired \* cattle for draft ever did answer. But when affairs in the Deckan assumed a settled appearance, it was not thought necessary to keep up those establishments to their full extent, and with a view to rendering us independent of the Mysore contractors, as well as to extending our means of supply, and also to improving the agricultural cattle of the country, I suggested

<sup>\*</sup> I ought to have said occasionally hired cattle, for those of the Hydrabad Subsidiary Force were hired, but permanently.

the distribution of a number of bulls of the Mysore breed throughout the Deckan. Many bulls were accordingly procured from the Company's breeding establishment at Mysore, but the plan being entrusted to the Collectors, who were already burdened with their other duties, failed entirely. The cattle in the Deckan are now in a worse state than ever, owing to the mortality in 1824, and if we had occasion to equip our Army in that country, I have great doubts how we should succeed. I would recommend, therefore, that the attention of the Military Board should be called to the means of improving the breed (in case they think any improvement necessary), and that they should be requested to state whether it might not be practicable, by distributing bulls over the country under proper superintendence, to provide a breed for Military purposes as well as for agricultural, without the expense of great establishments to rear cattle for Military purposes alone.

MOUNTSTUART ELPHINSTONE.

## IMPRESSMENT OF CARRIAGE.

### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

As the order had been published, I was desirous if possible to avoid recalling it; but as it must now be recalled to admit of a regular discussion on the subject, I consider everything to stand where it did before the publication.

I have read the letters I then called for, and the effect has been, to strengthen my opinion of the impolicy of any interference on the part of Government or its officers. The great objections to the sort of interference which has been adopted at Madras, of forbidding force, but enjoining persuasion on the part of the Civil establishment, are—1st, that such a system will infallibly degenerate into the old plan of pure force; 2nd, that by holding out some hopes of assistance in the course of a journey, it prevents that exertion on the part of the traveller to complete his means of transport or to retrench his baggage, which he would certainly have recourse to if he knew that he had no other means to trust to.

The first of these consequences arises partly from the circumstance pointed out in the proceedings of the Bengal Committee, that the Native Civil Officers have an interest in keeping up the system of forced labour, by which they benefit more than any other description of people, and partly from the fact that those functionaries are easily intimidated, and if a traveller has an order to show for their assistance in procuring carriage for-him, they will be very apt to be guided in respect to the means by his notions of propriety, being much more afraid of the consequence of his displeasure, than of any clamour that may be raised among the Ryots. The instance mentioned by Mr. Warden, also shows that even European Officers will misunderstand the intentions of Government, and will think the order for assistance is the essential part, and the prohibition of force more for appearance than reality.

The 2nd objection was partly removed by the modification last suggested by His Excellency the Commander in Chief, and it was this that led me to acquiesce in the order after it had been published. His Excellency makes it a condition, before aid can be claimed, that the traveller should be provided with a certificate that he left the station from which he set out with his carriage complete. If this rule were strictly enforced, it would strike at the root of the evil, for no man who was already provided with carriage, would think of pressing coolies; but it would require a strict system of muster to enable the Commanding Officer to certify that an officer had carriage for all the baggage which he chose to carry in addition to his camp equipage, and the proceedings of the Bengal Committee have also suggested to me, that the same sort of certificate should be required for every traveller's servants, since it appears to be their baggage more than their master's that lead to these calls on the villagers.

I think, therefore, that the order should not be published, and that the present Regulation should be allowed to operate, as it probably will do in time, both to diminish the demands of travellers and increase the means of voluntary supply.

MOUNTSTUART ELPHINSTONE.

12th September 1827.

## TELEGRAPH.

#### MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

The cost of printing 300 copies of the Dictionary would be 2,000 Rupees, and that of making up the great number of Telegraphs recommended would not I conceive increase the expense to more than 3,000, or at most 4,000 Rupees in all.

I should not therefore in ordinary circumstance have the least hesitation in recommending the immediate adoption of Colonel Goodfellow's suggestion, and further, of recommending that the use of the telegraphs should be introduced experimentally in the most extensive manner in Cutch.

It is in war chiefly (though not entirely) that the benefit of these contrivances would be felt; but whatever is to be used in war must be prepared in peace.

As Captain Jacob's services cannot be spared from his station, and as every expense, however trifling, ought to be forborne at present, if not indispensable, I will not recommend that any measure be adopted in consequence of this report, but that a letter be written to Captain Jacob (or in whatever may be the regular channel), expressing the sense entertained by the Governor in Council of the zeal for the public service that led him to undertake his compilation, and of the ability with which he had executed it, and acquainting him that, although the present time is not favourable for the adoption of the plans he has so meritoriously organized, yet the consideration of them will not fail, at a future period, to engage the attention of the Governor in Council.

MOUNTSTUART ELPHINSTONE.

## TELEGRAPH.

## MINUTE BY THE HONORABLE MOUNTSTUART ELPHINSTONE.

It would be presumption in me to offer an opinion on such a subject in opposition to that of the Commander in Chief. I there-

fore make over to Colonel Pasley the task of explaining his plan (as is done in the accompanying book), and I shall only mention two situations, perhaps peculiar to this country, where a telegraph might be more useful than it would be elsewhere. The first is the siege of a hill fort, where the besiegers are in possession of a point visible to two detachments, the road distance between which is from 25 to 35 miles. Another is where numerous detachments are watching predatory hordes, as in Cutch, and where everything depends on rapid communication of intelligence of the way they have taken and places they have been seen at, the direction they are moving at, &c. I merely mention this to explain my first. Minute. It is not proposed that any immediate steps should be taken for the adoption of the proposed telegraph.

# REVENUE SURVEY & ASSESSMENT

OF THE

# MORA TALOOKA,

IN THE

## HYDRABAD COLLECTORATE.

IN SIND.

## Bombay:

PRINTED FOR GOVERNMENT

AT THE EDUCATION SOCIETY'S PRESS, BYCULLA.

1867.

Price Rs. 1-8-0.

From the COMMISSIONER IN SIND,

To His Excellency the Honourable Sir H. P. E. FRERE, G.C.S.I. & K.C.B.,

Governor and President in Council, Bombay.

Commissioner's Office, Camp Anundro, 31st January 1867.

Honourable Sir,—I • beg to submit for your Excellency's approval the Settlement made by Major Taverner of the Mora Talooka in the Hydrabad Collectorate, with the remarks of Major Phillips and Major Francis.

- 2. The Talooka of Mora is situated to the north of Sukkurund and south of Nowshera. Its area is 703.86 square miles, of which one-filteenth is under cultivation. The remaining portion consists of sterile sandy soil, and culturable soil of too high a level to be irrigated by the canals in existence.
  - 3. The maximum rates proposed are as follows:

3	Churkee.	Moke.	Daka.	Sailab.
1st Class Dehs 2nd do 3rd do 4th do 51h do	Rs. a. 1 6 1 4 1 2 1 0 0 14	Rs. a. 2 8 2 4 2 0 2 0 1 12	cultivation	Rs. a.  Rs. a.  Rs. a.  Rs. a.  Rs. a.  Rs. a.  Rowler of the control of the cont

4 The above rates are considered suitable by Majors. Phillips and Francis, and have my approval.

- 5. The financial result of the settlement will be a survey assessed revenue of Rs. 73,979 against a past average revenue of Rs. 64,022, and of 58,624, the realised revenue of the year 1865-66, the same being an increase of 12 and 25 per cent. respectively. There is also a further sum of Rs. 4,905 on lands lying fallow which may or may not be taken up, whilst the waste unassessed culturable lands extend over an area of 148,997 acres, the greater part of which, however, is beyond the reach of irrigation.
  - There are only three questions in Major Taverner's report that require any comment from me. His treatment of the Baranee lands, of Waee lands, and the number of revenue instalments he recommends. Major Francis proposed on a former occasion, that they should be rented to the village community at a small annual assessment, but Major Taverner is of opinion that the fall of rain is so small and uncer aih in Sind, and the cultivation so fluctuating in amount, that it is much better to have a crop assessment. If Major Francis' profosals were carried out, the people would consider it a grievance to have to pay on land they were unable to cultivate for want of rain, and Government would lose considerably in a good Barance season. In Barance lands situated at the foot of hills and receiving their supply of water from mountain torrents the cultivation is more certain, and Major Francis' plan might be carried out, but in the plains the case is different, and I am inclined to concur in Major Taverner's views, in which the Collector of Hydrabad agrees likewise.
  - 7. It is unfortunate that Major Taverner did not ascertain the state of the canal on which he mentions the cultivation had declined. Had he done so he would have found that the decrease was entirely owing to an insufficiency of water, and had nothing to do with Barance cultivation, which produces a very inferior crop in comparison with Churkee cultivation with a proper supply of water.
  - 8. The Sindee cultivators are as sensible and prudent as the same classes in other parts of India, and never put themselves to the expense and trouble of migrating to other localities as long as

the supply of water in the canals on which their lands are situated is sufficient. Should it not be sufficient they will do so, but will return immediately their own canals have been put into working order.

- 9. Waee lands are supposed to be on a stratum which affords a supply of water within a few feet of the surface; a waee or pit is dug at a cost of 20 to 15 rupees, and a Rubbee crop is grown in addition to the Khurreef. Major Taverner has assessed these at 2 annas higher than common Khurreef lands. This Major Francis thinks too low; but as the cultivators of this district are badly off for canals, and consequently very poor, I would not add anything to Major Taverner's rates.
- 10. As for the instalments they are the same in number as are in force throughout Sind, and I think should not be altered. The Sindee cultivator is still very poor, and has a long way to make up before he arrives at the prosperity enjoyed by the ryots of the other parts of the Bombay Presidency, and it is of great importance that he should not be called on to pay his revenue before his crops are ready for the market.
- 11. In anticipation of the orders of your Excellency in Council, I have desired Major Taverner to introduce his settlement.
- 12. I would suggest that the entire correspondence be printed as a Government selection, and fifteen copies forwarded for distribution.

I have the honour to be, &c.

S. MANSFIELD, Commissioner in Sind.

#### No. 222 of 1866.

From Major E. L. TAVERNER,

Settlement Officer Left Bank Districts,

To Major F. PHILLIPS,

Collector of Hydrabad.

#### Dated 19th October 1866.

- SIR,—I have the honour to forward my Assessment Report, with accompanying map, of Talooka Mora, and to propose the introduction of the settlement assessment for a period of ten years, commencing from the Khurr effor 1867-68.
- 2. Mora Talooka is bounded on the north by Talooka Nowshera and by a portion of His Highness Meer Ali Morad's territory, on the cast and south by Talooka Sukkurwud, and on the west by the river Indus. Its mean length is about 45 miles, with a mean width of 16 miles, and its area, according to the Revenue Surveyor's computation, consists of 703.86 square miles.
- 3. The chief towns are Mora and Dowlutpoor; Guchero, Sehra, Suddoja, and Shahpoor are also fair-sized villages. In the town of Mora a large quantity of native soap is manufactured, but the population generally, as elsewhere in Sind, confine themselves to agriculture. The main postal road to Rohree runs through the Sunsaoree Tuppa, but the chief road of the talooka is from Dowlutpoor through Mora to Nowshera, with a branch from Mora to Sehra.
  - 4. The canals consist of the Dyanwa, the Dumba, the Meerwa, and the Dadwa. These are cleared by Government at an average annual cost of Rs. 9,607. There are no zemindaree canals of any size in the district.
- 5. The talooka is divided into eight tuppas, viz. Sehra, Manalwin, Paorun, Wud Pagza, Mora, Guckere, Dowlutpoor, and

Sunsa ree, containing in all fifty-five dehs or villages. The only alterations made in these dehs by the settlement are—first, in Deh Sunstoree, from which the Gungo Thurr, consisting of a mass of sand-hills, and producing nothing but rain cultivation, has been separated and made into a separate deh under the sanction of the Commissioner in Sind's letter No. 2253, dated 20th December 1864. Secondly, in the 2nd class jagheer of Deh Koonda, of which a large portion lapsed to Government during the last few years. This portion has been separately demarcated from the. jagheer lands. I have consequently caused it to be separately mapped and measured, and have to request sanction for its constitution as a separate deh under the name of Koonda Munda, And lastly there is a small piece of land of about forty acres lying in the lands of Deh Kullora, but of which the revenue is at present collected in Deh Bellal. This has been measured into Deh Kullora, a zemindaree and right of occurs remaining as 

viz. Furced Dera, Ghungun, Depurja, Kainchee, Dheerun, and Dim. which pay no revenue other than hucaba to Government; nine of 2nd class jagheers, viz. Kaim Koor, Bet Suffun, Chunneja, Salzehpoor, Alla Khaee, Galund, Nungur, Jurr Koharo, and Koonda, of which the most pay chouth or other portion of their revenue to Government, from which account an average annual sam of Rs \$25 is obtained; and forty debsare Government villages. The deb of Chuncja contains a portion of Government land, known as Mukly a Pye, which has been measured into survey Nos. and assessed. The average annual realisations on account, of hucaba, from the abovementioned jugheer villages amounts to Rs. 2,123.

7. Of the forty Government dehs, those of Gungo Thurs, and Mecrooor alone remain unmeasured and unassessed. The first consists of a mass of sand-hills, the second of a submerged village, on the remaining kutcha lands of which a revenue averaging Rs. 96 has lately been collected; but the cultivation in this land is so uncertain that the existing system of annual crop measurements; will have to be continued in it. The Government villages of Rajawa, Khurr, and Mulwa contain 3rd and 4th class jagheers.

which jagheers have been measured into survey Nos. and classified against the time when they will fall into Government.

The talooka of Mora, although adjacent to Talooka Nowshera, did not form part of the district known as Sahittee, which continued to forma portion of the territory of His Highness Meer Ali Morad until 1852, but at once became British territory after the battle of Mean. Taking the division of Sind into Upper and Lower by the Lukee hills, at about the line of Schwan (which is nearly opposite Dowlutpoer), Talooka Mora forms the most southern of the Upper Sind districts, and in its southern portion the dry and comparatively barren country commences which stretches through Talooka Sukkurund, leaving a fertile strip of only a few miles in width on the banks of the Indus. From Mora to Pubjo, a distance of thirteen or fourteen miles, there is hardly a trace of cultivation to be met with: the soil is either sand or salt. About level and Sunn the land the servery three or four years, or the water. supply furnished from the tails of the Nowlukkee and Dadwa is uncertain. The fertile portion of the talooka is very fairly defined by the road from Dowlutpoor to Mora and Nowshera. Westward of this the soil is good and fall of moisture, and there is a large proportion of sailab cultivation. Eastward of the road the soil is dry and high-lying. The second line of tuppas (those lying between the river-side tuppes and the dry inland typpas) that are found throughout the talookas of Kundiara and Nowshera, and that contain the best of all khurreef lands, are almost wanting in this talooka, especially in its southern portions. Mora Talooka contains a larger proportion of sailab lands than either of the \* talookas already settled; indeed, with the exception of Sunsaorce, its tuppas are all more or less sailab, and its revenue is consequently more fluctuating, as may be seen in the great falling off that has taken place in 1865-66, compared with the three preceding years. The moke lands are not very extensive, and are mostly confined to a few villages, but where they do exist they are very good, and admit of a larger percentage of their surface being sown with rice than lands of a corresponding description in Talooka Nowshera. The daka cultivation is good, and

is chiefly carried on on the banks of the inland dhunds and wahoors, shown on the map, in tuppas Mora, Guchero, and Dowlutpoor. The talooka has hitherto been more lightly assessed than Talooka Nowshera, and the assessment fixed upon its several dehs bears somewhat unequally on different portions of the talooka. For example in Deh Kureja, Tuppa Schra, by looking at statement No. 111. of the existing rate per jureeb, it will be seen that it pays Rs. 1-12-0 for sailab and Rs. 2-2-0 for daka cultivation, whilst dehs Koorace and Khokur in Tuppa Mora, which are equally well situated with equally good daka. and only somewhat inferior sailab, pay but Rs. 0-14-0 and Rs. 1-4-0respectively, or little more than half the above. Tuppa Guchero is on the whole more highly assessed than the adjoining one of Dowlutpoor, Mora, and Pooran. This probably arose from the gion of certain portions of the talooka being more developed than officers at the time of fixing the and I bring the fact to be increase and decrease in the the ende of villages consequent on the application of one general maximum rate for the villages of each class for the entire talooka. I trust that a consideration of the rates per acre, of the number. of fallows required, of the amount of the culturable waste, of the nature of the cultivation of each village and of its position as shown in the maps, taken together with its past rates, will serve to show that the assessment has been carefully considered for each deh. With the classification of one deh, Koonda Nundo, Iam not satisfied, and I have ordered my classing assistant to revise it before the introduction of the assessment; but it is only right to mention that this is chiefly owing to the pertinacity with which the zemindar of the deh refused, both at the time of measurement and classification, either to measure or point out the boundaries of his land, and as his haris were equally sullen, land that should & have been brought under assessment has been left in the unassessed waste. Under the provisions of the Summary Act this case can now be remedied.

9. Taking all the circumstances mentioned in the foregoing paragraphs into consideration, I have fixed the following maximum rates for the different descriptions of cultivation in the talooka:

	April Ages, and we have a price of the first day, April Age (Age) and Ages (Age)		Chu	rkee.	Мо	ke.	Daka	ι.	Sai	lab.
1st 2nd 3rd 4th 5th	Class Dehs do. do. do. do.	• •	Rs. 1 1 1 0	a. 6 4 2 0,	Rs. 2 2 2 2 1	a. 8 4 0 0	Rs. 4 3 Note.—T cultivat in 1st	ion is:	ill con	aprised

- of Talooka Nowshera, the moke rate four annas lower than that of Talooka Nowshera, the moke rate four annas or a class higher. The daka rate is the same as that of Nowshera, the sailab eight annas or one class lower. The chief increase falls upon the best khurreef and moke lands, as there is a species of cultivation carried on in these lands known as the cultivation under "wave which makes the lands hown as the cultivation under "wave which makes the lands for about two years, that are seen that a cost of from fifteen to twenty rupees, and by these means rubbee crops are grown in rotation with the khurreef. I have treated these lands on the same principle as that by which the "dusota" rate was fixed on the best rice lands of the Concan, and the order for their classification is laid down in paragraph 11, Chapter XV. of the Code of Rules for the department, and is as follows:—
  - 11. "The khurreef 'wheel' and 'moke' lands described in Chapter V. Section 6, in which rubbee crops can be raised as rotation crops by means of 'waees' or pits dug for cater in the field, are to have an enhancement of one or two annas, as the case may require, given to their water classification. This enhancement is not to be given merely to those fields in which 'waees' actually exist at the time of classification, but whenever a classer finds that cultivation by means of 'waees' is carried on in the village he is said to classify he will at once report the fact to the officer of the establishment. The officer will then personally inspect the land, and define, according to his judgment, by a pencil line on the field copy of the village map the extent of land for which the

enhancement in the classification is to be given for the capacity of sinking "waees" in its surface; and he will further determine the numbers that require to have their water classification enhanced on this account by two annas, and those for which one anna will be sufficient. Well lands, "chahee," and gardens contained within the circuit of the ground thus defined by the officer are to have their water classification enhanced in like manner. In the register the remark for this description of cultivation is to be entered in the column of the water supply as from a canal (name) and "waee." This order does not apply to sailab lands.

12. About Rs. 8,000 worth of revenue is derived from khurreef lands thus classed under "waces." This should be borne in mind when looking at the contrasting statement No. II., in which statement the revenue derivable from these lands (in the past years in which they produced rubbee crops) has been entered under the chadings of "daka" or "chahee" (well lands).

in the survey registers as "churkee" or "moke waces," and have been separately shown in the settlement khatas; and I have to propose that the revenue of these lands be collected in six equal instalments—three in the khurreef and three in the rubbee. The cultivator has generally some of his wace lands under khurreef and some under rubbee cultivation each year; thus this arrangement would have the effect of meeting more nearly his requirements for paying the assessment than if the whole revenue were collected in the khurreef season.

14. In the village of Korace there is a reay or river kutcha, survey No. 109, consisting of 748 acres more or less cultivated, and entered as belonging to the community, or raj of Korace generally. This I propose to offer at a lump assessment of Rs. 600, upon condition that the occupants become severally and jointly responsible for the payment of the entire assessment so fixed, and that claim for proportional remission will only be attended to should one-tenth or more of the land of the survey No. be washed away; whilst on the other hand fresh deposit exceeding one-tenth of the present survey No. will become hable for a proportional

increase of assessment. This is in accordance with His Excellency Sir Bartle Frere's rules on alluvion and diluvion, paragraph 6, dated 22nd May 1852. Should the offer be rejected, the present system of cross measurement will have to be continued in this survey No.

- 15. In like manner in an island in the river in the jagheer deh of Salyehpoor there is a mukkan called Bumba Dera, of which a portion, survey No. 1, of 509 acres, is ryottee, and has been entered on the register in the name of Syud Noor Mahomed Shah. In the deh of Khyro Dera there are five reay kutcha survey Nos., from Nos. 105 to 110, containing 243 acres entered as Government Nos. In the deh of Guchero there is one survey. No. 59, of 144 acres, entered in the name of Alla Oobbaee and Futteh Mahomed Bhogia and other Lugharce. In Deh Koonda Nunda there are two survey Nos., 59 and 60, of 109 acres, entered in the name of Jheeno Pulce and others. In Deh Dowlutpoor there is a large reay kutcha survey No. 174, of 1,537 acres, entered in the name of the tribe of the Hotee Potras war all this reay kutcha land the cultivation is so desultory and uncertain that it will have to be left for annual cross measurement, as at present.
- The amount of revenue realisations from baranee cultivation in the talooka during the last seven years amounts to but Rupees 3,912, and this is chiefly in the Sunsacree Tuppa; of this amount the sum of Rupees 2,838 was realised in one year. 1863-64, the balance in the remaining years. No workable average for a fixed assessment can be obtained from such a very fluctuating and chance source of revenue as the foregoing shows the barance to be, even in years in which rain falls. There is, moreover, the significant fact that in this year, 1863-64, the regular wheel cultivation of the Sunsaoree Tuppa descended from Rupees 10,094 to Rupees 6,815, to rise to Rupees 9,315 again next year. This I think argues against giving out the whole barance cultivation of a village at an average fixed sum, as the evenue Survey Commissioner had hoped could have been enected. The fall of rain in Sind is so uncertain and unequal from year to year, and the extent of the consequent barance

- cultivation so fluctuating, that I am disposed to think that a crop measurement in the years when rain does fall is the only method that can be carried out to meet the requirements of the case.
- 17. The only deductions that require to be made from the survey assessment on account of the hucaba of lands irrigated from zemindarce canals consist of Rupces 55, viz. Rupces 36 in Deh Kareja, Rupees 2 in Deh Kullora, Rupees 3 in Deh Kot Sutabo, and Rupees 14 in Deh Sulba. I here wish to notice that in your forwarding letter No. 2171, dated 27th September 1866, on my assessment report for a portion of the Nowshera Talooka (with a copy of which you kindly furnished me), you expressed a wish that the portions of the survey assessment that represent the land rent and water assessment respectively should be \*samarately shown in my assessment reports. This, however, I am unable to work out until the entire lands under each canal, extending sometimes over two or three talookas, have been measured, and settled. When this has been effected, the exact stail representing the water rate and assessment of each deh will be entered on the village register. Meanwhile a temporary rate of two annas per rupce of assessment is to be levied under. the Revenue Survey Commissioner's letter No. 178, dated 8th August 1865. I have some time since forwarded a plan for showing separately the land and water assessment of the Rohree Talooka to Major Francis for approval, and this plan is, I believe, at present with the Collector of Shikarpoor. On Major Francis'. reply I shall be enabled to show the land and water assessment for Talooka Kundiara in the manner above-mentioned.
- 18. I have Mentively reperused the form of Proclamation composed by the Revenue Survey Commissioner, the Collector of Shikarpoor, and myself jointly for Talooka Rohree, and propose the same form for Talooka Mora. A copy is herewith appended.
- 19. A census and diagram of the talooka, statements Nos. VI. and IV., are appended.
- 20. Lastly, the financial result of the settlement will be a survey assessed revenue of Rs. 73,979, against a past average

revenue of Rs. 64,022, and of Rs. 58,624 the realised revenue of the year 1865-66, the same being an increase of 12 and 26 per cent. respectively. There is also a further sum of Rs. 4,905 on lands, long fallow, which may or may not be taken up, whilst the waste unassessed culturable lands extend over the large area of 148,997 acres. Much of this land is, however, comprised in the tuppa of Sunsaoree, and is beyond the reach of irrigation from existing canals.

I have the honour to be, &c.,

E. L. TAVERNER, Major,
Settlement Officer, Left Bank Districts.

Settlement Office, Hydrabad, 19th October 1866.

E. L. TAVERNER, Major, Settlement Officer Left Bank Districts Settlement Office, Hydrabad, 19th October 1866.

### PROCLAMATION.

To all the Landholders and Cultivators of the Tuppas of Sehra, Munalim, Wud Pagya, Mora, Guchero, Poorun, Sunsaorce, and Dowlutpoor, Talooka Mora, in the Hydrabad\*Collectorate.

### BE IT KNOWN.

- 1. Government has decided upon introducing the Survey Settlement rates of Assessments into the above Tuppas, for a period of ten years, commencing from the Khurreef of 1867-68, Fuslee year 1278-79.
- 2. During this period Government guarantees that the rates fixed at the Lummabundee shall not be increased nor altered, and the survey assessment shall be held to cover all demands for imperial land revenue on the lands so assessed, with the exception of the reservation specially mentioned in the succeeding paragraph. Provided always, that in manifest cases of mistake or fraud, it shall be competent to Government to cause such error or fraud to be rectified.
- 3. With reference to the foregoing paragraph Government reserves to itself the right of levying such further cess upon the land as may be, by law, from time to time, imposed for educational and local purposes, and secondly, should Government hereafter construct or improve canals or other irrigational works in the settled tuppas above-mentioned, or to take up the clearance of canals now cleared at the cost of the zemindars and landholders, an increased assessment in proportion to the advantage thus accruing will be levied on all lands benefiting by such improvements.
- 4. The principle of the survey settlement is to divide the culturable land of each description of cultivation into estates or fields, called survey Nos., and to place an assessment on such lands to be paid by the holder, whether he cultivates his fields or not, so long as the land remains in the Government khata in his name. [It being a rule that the field and the fallows required that in all cases be considered as constituting one number, which must be all retained or relinquished. F. P.]

- 5. For the first year of the settlement all lands that have been entered at the time of measurement and classification in the name of the holder on the survey register, will, unless relinquished by him, being present, or, in his absence, by his authorized agent, be finally entered in his name at the time of jummabundee, and he will be held responsible for the payment of the assessment for that year.
- 6. At the time of jummabundee, any landholder being then present or probably represented, may relinquish the whole, or any part of his holdings, provided only that survey Nos. be not broken up, but it must be clearly understood that relinquishment of lands, whether at the time of jummabundee, or at any subsequent period, entails the forfeiture for ever of all rights over the lands so relinquished.
- 7. In this manner, holdings, or parts of holdings being whole survey Nos., may be relinquished at any time during the period of the settlement, provided that notice of such intended relinquishment be given in writing to the Mooktyarkar on or before the 31st day of March in each year, and the holder's interest in, and liability on account of the holding so relinquished will be confined to the collection of the crop then growing therein, and the payment of the Government demand thereon for the year then current. [Subject to the additional clause to S. 4. F.P.]
- 8. All relinquished holdings will be put up to auction under the orders of the Collector, and disposed of in conformity with such instructions as may be issued from time to time by the Commissioner in Sind.
- 9. The co-sharers in a survey No. will be held severally and jointly responsible for the entire Government assessment placed upon the number; they may, however, freely sell or mort-gage their share of the right of occupancy in each Survey No., and the purchaser of such share will become liable, under the Government Khatadar, for the assessment of the field or survey No., as if he were one of the original shareholders.

- 10. Government is pleased to allow all "kochas" or plantations of trees, now held free, under His Excellency Sir Bartle Frere's Circular No. 481, dated 6th March 1858, to continue to be so held, in accordance with the condition therein contained, viz: that they be kept up as plantations; otherwise, or if cultivated, or cropped, they will be liable to the payment of the survey assessment that has been paid [query, fixed? F.P.] for them in each case.
- 11. Holders and cultivators of survey Nos are bound to keep the survey boundary marks of their fields in preservation and repair, and wilful destruction of a boundary mark, or of a boundary line running around a survey No., or neglect in repairing such marks, &c., when ordered to do so is punishable by law.
- 12. The large waste tracts of land, within village boundaries that have never been cultivated or have fallen out of cultivation for a long period, and on which no assessment has been fixed at the time of the settlement, have been entered in the survey records in the name of Government, and persons desirous of bringing such lands into cultivation must apply to the Collector for a lease of the land required.

Notice, therefore, is hereby given that all persons having any interest, claim, or dispute in the land or lands of any survey No. or Nos. in the tuppas aforesaid, are required to present themselves either in person or by authorized agent, with their documents and witnesses, before the Settlement Officer, Left Bank Districts, on the day or days appointed for the jummabundee of the village in which the said land or lands is or are situated, and then and there to prove their claims and to take up their lands at the survey rates, or to sign a paper of relinquishment of the same. In the event of absence, or of the lands that have been recorded in his name without dispute, at the time of measurement and classification of the village, with the entered in the Government khata in his name, and he will be held responsible for the payment of the assessment

on such lands for the first year; and in cases of disputed possession the Settlement Officer will, at once, settle the right of possession, on the amount of evidence then and there obtainable, and his award will remain in force until altered, revised, or set aside by the decree of a Civil Court; and further be it known that any act done by the khatadar or chief shareholder of a holding or survey No. at the time of jummabundee, without protest from or in the absence of the remaining shareholders shall be considered to be the act of the entire body of shareholders, and shall be adopted accordingly. [I concur. F. P.]

No. 2526 of 1866.

REVENUE DEPARTMENT.

From the COLLECTOR OF HYDRABAD,

To Major J. FRANCIS,

Survey Commissioner.

Hydrabad, Collector's Office,
Camp Sheih Birkio, 19th November 1866.

Sir,—I have the honour to submit Major Taverner's report, No. 222, dated 19th October, with accompaniments, being his proposed settlement of the Mora Talooka of this Collectorate.

- 2. I request sanction that the lapsed Jagheer portion of Deh Kundo may be constituted into a separate Deh, as proposed in the Settlement Officer's 5th paragraph.
- 3. With reference to Major Taverner's 6th paragraph and the statements, I observe that the shares levied by Government on certain second class Jagheers, have not been interfered with, and I concur with him in considering that as regards this source of Government revenue, existing arrangements should be allowed to stand. And I presume also, that it is not intended to make any alteration in the system of leying water tax from the Jagheerdars, and with which they are, as a class, content.

- 4. This point must, however, remain so far open, that the receipt of the Hucaba report, promised in the Settlement Officer's 17th paragraph must be awaited; but I would beg to record my opinion that it is not desirable on grounds of general policy, and also owing to the poverty of the Jagheerdars as a class, to increase in any way the Government demands on their estates.
- 5. I agree generally with the opinion expressed in the Settlement Officer's 8th paragraph, except that I consider the land in the Sun Tuppa at the tails of the Dadwah to be very well supplied with water, especially about and south of Pubjo. Indeed the tail canal called the Meerwah, runs south into the Sukrund Talooka, and irrigates a large quantity of land in the Goram Murree Tuppa, nor has scarcity of water even at the extreme tail been ever experienced, since Government dug the new mouth to the Dadwah near the village of Mittance.
- 6. But Major Taverner is correct in stating that the supply from the tails of the Nowhikky (Baghwah and Moradwah) which flow into the north-eastern portion of Mora is fluctuating. This has engaged the attention of the Engineer officers, and to a certain extent the Moradwah has been improved, and a new mouth is proposed for the Baghwah.
- 7. I approve of the maximum rates proposed in the Settlement Officer's 10th paragraph, and which he has fixed after giving the local features and peculiarities of the Talooka careful consideration, whereas the temporary rates now existing were fixed with reference to the average revenue of each Deh, and more in order not to enhance this, than with a due regard to the capabilities of the locality; hence it has happened, that fertile portions have been more easily assessed than others less abundantly productive.
- 8. Major Taverner has, I think, judiciously fixed the rates for Sailab, Daka, and Wahee Moke lands along the Guchero, Mora; Munahim, and Schra Tuppas. To the west of the Hydrabad road the soil is full of moisture and some fine dunds of water are always available for rubbee crops. The people may therefore look forward with certainty to a sufficiency of water.

- 9. I have no objection to the proposal made by the Settlement Officer in his 13th paragraph, regarding the mode of levying the revenue from the Moke Rubbee lands; the instalments may be equal in amount, and the number of instalments corresponds with that in which the revenue is usually levied.
- 10. I concur also in the proposal made in his 14th paragraph to lease the Koraee cutcha lands.
- 11. As regards the cutcha lands named in paragraph 15, I would prefer a similar plan being adopted at the time of jummabundy, if possible, in order to avoid crop measurement. But if the zemindars are unwilling to take up the leases, there will be no other plan open than that of annual summary assessment after measurement, and at existing rates.
  - 12. I recommend that the assessment of rain crops shall be left in the hands of the Collector, and that no attempt be made to make a permanent settlement of this description of cultivation.
  - 13. The financial result of Major Taverner's proposed settlement, as shown in his 20th paragraph, may be considered favourable, and will in good seasons of rain be increased by rain cultivation in the Deh of Gunga Thurr, of the same Tuppa.
  - 14. I have noted my opinion against each paragraph of the proposed proclamation.

I have the honour to be, &c.,

F. PHILLIPS, Collector.

### CORRESPONDENCE

RELATIVE TO THE

### -SETTLEMENT OF THE MORA TALOOKA-

Settlement Officer's Report No. 222 of 1866, and Collector's transmitting letter No. 2526, dated 19th November 1866.

### No. 33 of 1866.

Poona, 9th January 1867.

Major Taverner's Report contains a full and interesting description of the natural features and capabilities of the district. Referring to its position, he explains that taking the Lukkee Hills as the natural division between Upper and Lower Sind, the Mora Talooka would form the most southern district, which, under this natural division of the country would belong to Upper Sind. And this boundary line is also said to indicate generally the division between the fertile tracts of the northern and the extensive sterile plains of the southern part of the Hydrabad Collectorate.

- 2. The Mora district contains a large proportion of this sterile sandy soil. From the town of Mora to Pabjo, a distance of between thirteen and fourteen miles, Major Taverner tells us "there is hardly a trace of cultivation to be met with, the soil being either sand or salt." And taking the entire talooka, I find that the assessed culturable portion of it bears the small proportion of only 15 per cent, to the total area.
- 3. Its water supply is uncertain and somewhat deficient also. The Dadwah and Meerwah canals are its main source of rrigation, but the district draws its supply mostly from the tend of these feeders. The Collector considers the supply in the Dadwah to be somewhat better than Major Taverner

represents it to be, owing to the recent opening of the new mouth to it near the village of Mittanee. But, admitting the Collector's estimate to be correct, the irrigation of the district generally may nevertheless be said to be inferior when compared with that enjoyed by the adjoining districts of Nowshera and Kundiara.

- 4. Giving due weight to these circumstances, and to the general condition of the district, Major Taverner has made his rates lower than those fixed for the adjoining talooka of Nowshera, with the exception of the lands under moke irrigation—for which, for special reasons, he has made an increase of four annas upon the rate fixed for the same cultivation in Nowshera. The Collector considers the Settlement Officer's proposals to be generally suitable for the district, and there seems to be good ground for supposing they will be found to be so.
- 5. There is a novel feature in the cultivation of this district which seems to call for special remark from me. I allude to the irrigation from waces or pits, referred to in paragraphs 10, 11, and 12 of the Settlement Officer's report. I am satisfied as to the correctness of the principle upon which these lands have been classified, and consider that Major Taverner has acted judiciously in having distributed his increased rate over the whole tract where the irrigation prevails, instead of confining it merely to the lands where existing pits are met with. Inequality in the fall of rates on contiguous fields would have been the result had the latter system of operations been adopted, but by the plan followed the whole there of country over which this water-bearing stratum extends is equitably assessed at a higher rate, in consideration of this inherent quality of the soil.
- 6. But although the plan of fixing the assessment is good, I am inclined to think the increased rate is not quite so high as it might be. According to Major Taverner's description of the cultivation an alternate khurreef and rubbee crop can be grown with the aid of this water. It may be inferred from this, that the fallow generally given to lands cultivated as khurreef is not requisite where this semi-rubbee cultivation is carried on.

If such be the case an extra rate of two annas per acre seems scarcely sufficient to meet the difference between the value of this mixed and of purely knurreef cultivation.

- 7. The distribution of the extra rate over a large area may probably be the reason for its having been fixed rather low. I shall refer to the Settlement Officer for explanation upon this point, for as his judgment in assessment matters has been proved to be so good hitherto, I should hesitate in proposing any change in his rates until the fullest inquiry had been made. The result of this reference shall be communicated hereafter.
- I am sorry to find both the Settlement Officer and Collector advocating the adoption of six Paragraph 13 of Settlement Officer's Report. instalments for the collection of the revenue from this mixed description of cultivation. This appears to me to be a retrograde movement, for we find in the Regulation Provinces that reducing the number of instalments tends to simplify revenue management, and gives more time to district officials for the performance of their other important duties. should think that three instalments fixed for the rubbee season would meet the case, for whether a man grows a khurreef or a rubbee crop he would not, under such an arrangement, be called on to pay his Revenue till the time considered suitable for the latter crop. I recommend this subject to your attention, and shall be glad if you agree in the view I take of it.
- 9. Major Taverner appears to have regularly settled down into the plan of leaving "Baranee" cultivation to be managed by the system of an annual crop measurement. And the Collector evidently looks upon its adoption with consider the satisfaction. I am by no means satisfied, however, that this course is preferable to that which has been suggested for the assessment of this cultivation in a former report upon the subject. At any rate I should like to see the suggested plan tried experimentally in one or two villages, though Mora perhaps is not a district in which the experiment should be made.

10. Great caution should, I think, be exercised in giving facilities for the extension of this desultory and uncertain cultivation. For we shall assuredly find, that the cultivators will leave

their regular assessed lands for the Barance if we put a low rate upon the latter. That there is a disposition to do so, may be inferred from the fact, mentioned by Major Taverner, of the wheel cultivation

Paragaph 16 of Settlement Officer's Report.

revenue having fallen in one year in the Sansaoree Tuppa from Rs. 10,094 to Rs. 6,815, whilst there was a corresponding

increase on the Baranee revenue. I think therefore that in districts where crop rates upon this cultivation are continued, they should be increased as a rate upon the introduction of the survey settlement, so as to have a deterrent effect upon its extension, and thereby secure the realization of the regular assessed revenue.

- 11. I would suggest that the Collector be called upon for a report upon this suggestion The introduction of the settlement need not be deferred pending the reference in the matter, as the cultivators might be informed that they would hereafter be told on what plan the Barance lands will, in future, be available to them for cultivation.
- 12. In his 17th paragraph Major Taverner refers to an Huccaba statement, which was sent to me some months since. It has just been returned by the Collector of Shikarpoor, to whom it was referred for his opinion. It has now been referred back to the Settlement Officer for his consideration of some modifications suggested by the Collector and myself, and will be handed on for final orders as soon as the points under discussion have been settled between us.
- 13. The Settlement Officer's proposals, adverted to in paragraphs 10 and 12 of Collector's letter, and approved of by that officer, appear to be suitable to the respective cases.
- 14. The Collector considers the financial result of the settlement to be favourable, and I agree that a measure which holds out promise of an increase of revenue varying fron 12 to 25 per cent. when compared with past average, and last year's collections, irrespective of the assessment which may be realized from lands long out of cultivation, may certainly be regarded in that light.

J. FRANCIS, Major, Survey and Settlement Commissioner.

### No. 1175.

Revenue Survey and Assessment.

### REVENUE DEPARTMENT:

Bombay Castle, 25th March 1867.

Letter from the Commissioner in Sind, No. 246, dated 31st January 1867—Submitting, with his observations, reports regarding the settlement made by Major Taverner, Settlement Officer, Left Bank Districts, of the Mora Talooka in the Hydrabad Collectorate; and stating that, in anticipation of the orders of Government, he has desired Major Taverner to introduce his Settlement.

Memorandum from the Commissioner in Sind, No. 443, dated 20th February 1867, with accompaniments—On the same subject.

RESOLUTION.—The Right Honorable the Governor in Council is pleased to sanction the imposition of these rates for a period of ten years. The financial results are an increase of some 12 per cent. over past average collections, viz. Rs. 73,979 as against Rs. 64,022.

- 2. The system on which the assessment on account of water derived from "waees," or pits, is to be imposed on all land containing a water-bearing stratum is approved; and from the explanation subsequently furnished by Major Taverner (Memorandum No. 15, dated the 21st January last), there can be no doubt that the rates proposed to be levied on this account are sufficiently high:
  - 3. While fully concurring with Colonel Francis as to the evils that must unavoidably result from a system of assessment according to the nature of each year's crop, His Excellency the Governor in Council, for the reasons given by the Commissioner and the Collector, fears that it is impossible to do away with it in the plain villages. He will be glad to learn that the Baranee lands, situated at the foot of the hills, have been rented to the several village communities at a fixed small annual assessment.

4. The proposal to reduce the number of instalments cannot be acceded to, as it does not meet with the approval of the Commissioner, but no guarantee should be given which will prevent any future reduction of the number of instalments.

F. S. CHAPMAN, Chief Secretary to Government.

To

The COMMISSIONER in SIND.

### No. 103 of 1867.

### To S. MANSFIELD, Esq.,

꾹 . .

Commissioner in Sind.

Camp Myjee, 31st January 1867.

\*Dated 9th instant.

Memorandum No. 33,\* upon the settlement proposed for the Mora Talooka, I have the honour to append copy of a communication from Major Taverner, submitting the information called for regarding the assessment of the land irrigated from waees or pits.

- 2. From the Settlement Officer's explanation, it will be seen that the addition made to the ordinary khurreef rate for this wave cultivation is equivalent to an increase of about 20 per cent. I was led to suppose at first that he had added only two annas to his rate, but two annas represent only the nominal classification value, which, worked out in the calculation of the assessment, amounts, as before mentioned, to an addition of 20 per cent. on the actual assessment imposed.
- 3. Major Taverner's memorandum contains some further information regarding the peculiarities of this cultivation. Judging from what he has explained, as also from the results of his operations given in the statement appended, I am now fully satisfied that his rates for this description of cultivation have been fairly apportioned, with reference to the general pitch of the assessment of the district. I would therefore beg to recommend that his proposals for this cultivation be finally sanctioned, together with the other proposals previously submitted for sanction.

I have the honour to be, &c.,

J. FRANCIS, Lieut Colonel, Survey and Settlement Commisioner.

### MEMORANDUM No. 15 of 1867.

In reply to the Survey and Settlement Commissioner's Memorandum No. 34, dated 9th January 1867, forwarding extract (paragraphs 5, 6, and 7) of his Memorandum, No. 33, dated 9th January 1867, on the subject of the Mora Assessment Report, the Settlement Officer, Left Bank Districts, has the honour to explain that the two anna enhancement therein referred to is a water classification, and not an actual money enhancement rate. The effect is to raise the rate per acreabout one-fifth of the assessment. Thus a field ordinarily classed at 2 rupees, will, by this classification, be raised to Rs. 2-9 per acre. This is in accordance with the gradation of the Settlement Commissioner's own classification scales, to which the Settlement Officer has always adhered, both for the sake of uniformity, and for the additional facilities in consequence accruing for any general revision of rates throughout the Collectorate.

2. The increase thus given is, in the Settlement Officer's opinion, sufficient, for the following reasons. The extra rate per acre (which is spread over a wide area) has to be paid in all years whether the cultivation be khurreef or subbee, and, in so far as the Settlement Officer can judge, there is not at present more than about one-fourth of the land over which this enhanced assessment has been placed under rubbee cultivation annually. This is to be accounted for in many ways. The waces become sooner exhausted than wells, and the area cultivated under them is consequently smaller, seldom exceeding from three to four acres; fallows are given but sparingly. Then it must always be remembered, that in the northern portion of the Hydrabad Collectorate there is no grass to speak of, so that cultivators are obliged to cultivate a certain area of jowaree and bajeree on account of the kurbee for the sustenance of their cattle; and, moreover, the villagers prefer having a proportion of both khurreef and rubbee lands to enable them to work their cattle throughout the two seasons. Settlement Commissioner must himself have observed lands near

khurreef crop to be raised upon them; and the Settlement Officer is of opinion, that so long as the present scarcity of population and cattle continue, the people will prefer (whatever increased water facilities may be given them for rubbee or rice cultivation) to keep a large area under jowaree and bajeree crops, for the reasons above given. Consequently, although an increase of rubbee cultivation in these wave lands may be expected under the influence of the settlement, it will not, the Settlement Officer is of opinion, be so extensive as to warrant a higher enhancement (in anticipation) of assessment than that he has now fixed for lands of this description.

3. In reply to paragraph 3 of the Settlement Commissioner's memorandum, the Settlement Officer begs to state that he is unable to show the correct amount of past realizations derived from waees, as these have been mixed up in the past revenue collections with the well and pure Daka assessment, all of which are under Daka rubbee wheels. He has, however, the honour to transmit the accompanying statement for five dehs, which will, he thinks, answer the requirements of the Survey Commissioner.

E. L. TAVERNER, Major, Settlement Officer, Left Bank Districts.

Settlement Office, Camp Turooshah, 21st January 1867.

## AN ACCOUNT

OF THE

### TALOOKDARS IN THE AHMEDABAD ZILLAH, &c.

THE estates of the Talookdars of Ahmedabad are situated in the four western Purgunnas of that district, and comprise nearly half of its total area. The following is a comparative statement of the extent of the territorial divisions of Guzerat:—

·	Square Miles.
Ahmedabad Talookdars	1,922
" Khalsa	2,492
Kaira, with Punch Mahals	2,937
Broach and Surat	
	10,308

The Talookdars are thus seen to occupy about one-fifth of the most fertile province of the Presidency, and a large number of their villages are especially important from their natural fitness for the growth of cotton, which has always been the staple produce of Dhundooka.

The Talookdaree districts taken in order from north to south

•	•	Area.
1. Veerunga	m (Choowal)Acres	1,67,837.17
2. Dholka		3,32,092.22
3. Dhundook	a ,,	6,11,693.12
4. Gogo	,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,	1,18,586.18
		12,30,209 29

The area of the two latter has been considerably reduced by the recent transfer of the estate of the Thakore of Bhownuggur to the province of Katheewar.

The Choowal of Veerumgam is a compact group of villages in the north-east corner of that l'urgunna. Its surface is a plain of light sandy soil, slightly elevated above the surrounding black soil, still in parts covered with the ancient jungle growth, and in all parts scantily wooded and enclosed. The principal produce consists in the commoner cereals. The people are simple and uncivilized.

The Dholka Purgunna is an open and level plain, sloping from north to south-west towards the salt flat and the lake called the Null. The Khalsa portion of the district on the Samburmutee river is the most fertile. The southern part, which is exclusively Talookdaree, is salt and bleak. In the northern portion rice is largely cultivated, but with few of the artificial aids which are necessary to secure a regular yield.

Dhundooka is a district even more open and treeless than the preceding. Wheat is grown on the border of the Gulf of Cambay, cotton in the central portion, and the commoner food grains in the west. This district contains the well known cotton port of Dholera, which was ceded to Government by the Talookdars who owned it.

Gogo is a small district considerably south of the above, and bounded on the east by the Gulf of Cambay. The area is hilly and intersected by numerous streams. The hills are formed of crumbling limestone, showing traces of volcanic disburbance. The soil is calcareous and stony, but collects in the valleys in a rich loam, which is highly productive. These valleys abound with the mango, the date, and the common timber trees of Guzerat. The climate is cool at all seasons.

The owners and tenantry of these districts do not greatly vary. From remoteness, from the tenure, and the character of the proprietary class, they nowhere approach to the high cultivation of Duskroee, or Nuriad. They approximate in all respects most closely to the adjoining province of Katheewar, with which their history was identified before the period of British rule.

It is not necessary to narrate the many dynastic changes of Katheewar before A.D. 1700, which may be studied at length in the Ras Mala. In the course of them, however, some of the noblest Rajpoot houses in the peninsula formed settlements in the The Choorasumas of Dhundooka are Talookdaree districts. descended from the Hindoo dynasty of Joonaghur, which was subverted by the Moguls at the end of the fifteenth century. Waghelas of Dholka are a remnant of the Solunkee race, who fled from Unhilwarra when that kingdom was destroyed by Allahoodeen in A. D. 1297. The Goels of Gogo emigrated from Marwar many centuries since, and, after pausing at Ranpoor, established themselves at Perim. The Jhalas of Dhundooka are akin to the Waghelas, and were first known as Mukwanas. The Thakurras of the Choowal are the offspring of Solunkees and Mukwanas, who intermarried with the Kolces of the Mhyo Kanta.

In this same early period also happened that immigration of the Kathees (Hindoos from Sind), which attacked the Choorasumas and Goels of Central Katheewar, and established itself in their room. The Kathees now occupy Ranpoor and the west of Dhundooka.

Next follow traces of the Mahomedan rule at Ahmedabad. These are but relics scattered through the districts, and few in number. There are naturally Mussulman elements in the population of the chief towns—Dholka, Ranpoor, Dhundooka, Gogo. But besides this there are a few estates still held by officers or grantees of the Mogul, or Mahratta. Thus an estate around Ranpoor is held by Molesulams, or converted Rajpoots of the Purmar tribe, who came from Sind about A. D. 1450, and were settled at Ranpoor by Muhmud Bigara. A branch of this house took service under the Mogul, and formed a large estate at Dholka. This branch is now represented by Sher Meia. There were later at Dholka in the service of the Mahrattas Mussulman Officers from Delhi of the Mena and Rehen clans. These also formed estates, and all, Purmars and Mussulmans, are called Kusbatees or men of the Kusba, or chief town, as opposed to the rural Chiefs.

There are Kushatees (so called) in Veerumgam a little different from these. They state that they came from Khorassan

to Puttun, and received a gift of villages from the Waghela kings. Their villages were taken from them under the Mahratta rule, and restored as on farm. They formerly had seventeen villages, but as they were unable to manage them the Collector took away eight and made them Khalsa, leaving the rest on a Talookdaree tenure.

Beneath is an abstract of these elements of population in each district:—

	Vıllages.
VECRUMGAM	Thakurras

These mixed elements are significant of the position and history of the districts.

The estates of the Ahmedabad Talookdars may be defined cographically as the border land between Guzerat proper and the peninsula of Katheewar, and historically as the coast where the debris of the old Rajpoot principalities of that peninsula was worn

and beaten by the successive waves of Mogul and Mahratta invasion. But they are part of Katheewar, rather than of Guzerat. Their proprietors are Katheewar Chiefs. Their communities have the same elements. There are Choorasumas in Oond, and Choorasumas in Dhundooka; Jhalas in Drangadra, and Jhalas in Dhundooka; Goels in Palitana, and Goels in Gogo Bara. In the part of the British district adjoining Jhalawar the Talookdars are Jhalas; in that adjoining Katheewar, Kathees; in that adjoining Goelwar, Goels; and in some instances there are Jhalas, Kathees and Goels, who hold villages both under Rajkote and under Ahmedabad. The States of Lathee and Wullah have villages in Gogo; those of Limree, Wudwan, Wankaneer, have villages in Dhundooka; that of Kutosun has villages in the Choowal.

Mr. Forbes thus describes the Mogul method of ruling this border country and Katheewar:—

"During the government of Guzerat by the Sultans (A. . 1400—1572), and afterwards by the imperial Soubhahdars stationed at Ahmedabad (A. D. 1572—1755), the Mahomedan authority was supported by garrisons placed in fortified positions throughout the country, which ensured to some extent the regular collection of the tributary revenue, and rendered expeditions for its enforcement, except in special cases, unnecessary. These posts, however, were gradually withdrawn or driven out, and amid the frequent scenes of anarchy which were witnessed during the last days of the Mogul Government not a few were the result of endeavours to collect the revenue due from the tributaries by annual military expeditions. This course, which with the Mahomedans was compulsory and exceptional, was with their successors congenial and regular."

In the better days of Mogul rule Todur Mul, the Minister of Akbar, divided all the districts of Guzerat under different provinces, or Sircars.\* Of all the Talookdaree districts Gogo alone appears in this division under the Sircar of Soreth, or Kathcewar. Dholka and Dhundooka are numbered among the better tamed

<sup>\*</sup> See the Ayeen Akbaree.

districts of the Ahmedabad Sircar, and so is Veerumgam under the name of Chalabarah, or Jhalawar. The port of Gogo (the Ostia of Cambay) was also under the latter Sircar.

The Mahrattas expressed the distinction between the two Sircars in new and more significant terms. They called Katheewar (where they could not appear without an armed force) the Moolukgiree country, while the other districts were called Rastee, or pacific. About A. D. 1760 they transferred the district of Gogo to the Rastee districts, and after this none of the Talookdaree districts remained in the Moolukgiree country. They were not, therefore, of those which maintained perfect political independence under former rules. Yet it would not appear that the peaceable districts were really much quieter than the Moolukgiree; for Colonel Walker says of the Peshwa's revenue that "the deficiency arose from the inability of the Komavisdars to maintain a sufficient body of troops, which are not only necessary to go on Moolukgiree, but to make the ordinary collections in Guzerat." The difference, however, appears to have been that in the Moolukgiree country there were no permanent Revenue Officers at all; whereas in the copy of the Deed passed by the Peshwa to the Gaekwar in granting him the lease of Ahmedabad in A. D. 1804 the establishment for each of the peaceable districts is specified among the charges. Thus for Gogo-

MujmoodarRs.	200
Treasurer,	150
Furnavees,	400

On the other hand, the only charges for Katheewar in the above Deed are the expenses of Military expeditions. Again, the Munotedar system is not found in use in the Rastee districts, but in the Moolukgiree expeditions "ready money was seldom obtained, but securities from the bankers, with whom all the villages had dealings, were preferable." In some of the Katheewar accounts there are no names of districts, but only of the Manotedars and Bhats who gave security, with the name of the Commanders of the Troops.

The period of the Mogul Soubhahdars ended with the death

of Mominkhan in A. D. 1743. He had shared the Guzerat revenues with Damajee Gaekwar for six years previous. When Damajee was captured by the Peshwa in the Deccan (1751) he had to surrender half his revenues to the latter, and conjointly they expelled from Ahmedabad Juwan Murdkhan Babee, the last supporter of the Mogul power (A. D. 1755). In the partition of the revenues, Dhundooka, Gogo and Veerumgam, fell to the Peshwa, and Dholka to the Gaekwar.

Not only all that is now called Veerungam, but also all the Katheewar province of Jhalawar, and Ranpoor (now attached to Dhundooka), were then included in that district. The following is a list of the districts then in Veerungam, extracted from a paper obtained from the house of an hereditary officer of the late Government at Ahmedabad:—

- 1. Havelee Veerumgam.
- 2. Limree.
- 3. Wankaneer.
- 4. Choora.
- 5. Wudwan.
- 6. Jhunjoowarra.
- 7. Hulwad.
- 8. Ranpoor.
- 9. Choowal (41 villages).
- 10. Dusura.
- 11. Bujana.
- 12. Secta Lukter.
- 13. Patree.

In 1799 the Peshwa farmed his Ahmedabad revenues, including the Katheewar tribute, for five years to Govindrow Gaekwar, and the latter appears to have found it convenient to transfer all the above, except Havelee Veerungam (or the Home district) and Ranpoor, to Moolukgiree management. In a memorandum by Trimbukrao Sudasev, Mujmoodar of Veerungam, it is stated—

\*Aboo Seelookur, the Peshwa's Soubhahdar. "Sumwut 1856 (A. D. 1799—1800) the City of Ahmedabad was taken from Seelookur\* by the Gaekwar.

From that day the Moolukgiree of Jhalawar has been separated

from Veerumgam and put under Moolukgiree management." It is thus seen that the Talookdars' estates were much akin to the Moolukgiree country, and yet distinguished from it. In the half century before British rule Gogo and Ranpoor were removed from Moolukgiree management, while part of Veerumgam was transferred to it; and the Choowal, although now treated like Dholka or Dhundooka, was exhibited as part of Katheewar in a Mahratta State paper as late as A. D. 1814. (Bombay Treaties, page 552).

It is, of course, familiar to all readers that the Moolukgiree country has been treated as foreign territory, and the tribute due from it fixed in perpetuity, while the Talookdars' estates have fallen under British jurisdiction with a rapidly increasing land tax. Yet no one who is familiar with both sides of the border can he sitate to decide that the advantage in peace and justice, and the other best elements of prosperity, is with the latter. The most powerful Chiefs and their advisers are the only gainers by an independence which has never so far been found to co-exist with tolerable security to the life and property of their subjects.

The Thakore of Bhownuggur was the immediate cause of the first acquisition in these parts of territory by the British. In the last years of the eighteenth century he was intriguing to get a footing in the Dhundooka estate of Dholera, and thereby drove the Grassias in 1798 to seek the protection of the British Government, who were then holding the balance (with occasional recourse to the sword) between the Peshwa and the Gaekwar in Guzerat.

In February 1802 the Bombay Government deputed Mr. Miguel de Souza, a Portuguese merchant, and their zealous, if not highly educated, Agent, to inspect this little cession. He says—"It

Mr. de Souza to Government, September 13, 1805, paragraph 6. immediately occurred to me that as these villages formed part of the Purgunnas of Dhundooka and Ranpoor

I should not be able to bring my views respecting that place (Dholera) completely to bear, nor to establish our trade, and be enabled to introduce it into Katheewar and Jhallawar, without having some control over those Purgunnas; and he accordingly moved

the Governor of Bombay to request the Resident at Poona to obtain for him from the Peshwa the farm of Dhundooka, Ranpoor and Gogo Barah. The Resident promised to watch for an opportunity to do so, and Mr. de Souza secured the promise of the farm from Raghoba at Baroda.

Of the cession of Dholera the Governor, Mr. Duncan, says-

To the Governor General, June 11th, 1802.

\* Query, Katheewar?

"In the view of improving our commercial, and eventually our political, intercourse with the peninsula of Guzerat,\* I have accepted the offer of Dholera, the Grassia proprietors

of which have been pressing me for the last four years to accept of this spot, their object in which has been the procuring protection for themselves against the depredations of their neighbours." And he continues that this "territory, situated under the Purgunnah of Dhundooka, is subject to a fixed Khundunee (tribute) to the Peshwa, who does not, however, appear to exert any interference in the internal management." The cession was sanctioned by the Gackwar (then the Peshwa's farmer), but not by the Peshwa himself. The Gackwar issued a Pur-

wana to the Grassias, in which he stipulates—"The Peshwa's Khundunce for the Purgunna of Dhundooka and the Sircar's usual Jummabundy to be regularly paid. The Honorable Company shall have the government of those villages, inhabit and cultivate them, and shall take upon themselves the management of the port, and hoist their flag."\*

<sup>\*</sup>This seems a strange proceeding, as the district was not Moolukgiree, but, to show that proportionally strange things were done in the Moolukgiree country, the case of Mowa, Wagnuggur, and Tulaja in 1771 may be noted. These were ports on the coast of the Gackwar's tributary district of Goelwar. A British expedition sailed against them from Surat, and, in co-operation with the Thakore of Bhownuggur, drove out the pirates who held them. In the record of this transaction the ports are called

Bombay Treaties, page 99.

"our conquests," and a fear is expressed "lest they fall into the hands of the Mahrattas," to avoid which one of them was sold to the Nawab of Cambay. Thus it seems that the British Government did not hesitate to make conquests in the Moolukgiree, and accept cessions by petty Chiefs in the other districts of Guzerat under the nominal rule of the Mahrattas.

Before the end of A.D. 1802 the treaty of Bassein was under discussion. On December 3rd, 1802, the Resident of Baroda was directed to prepare and send down, as soon as possible, an authentic statement of the Peshwa's Purgunnas, with their full annual value, under the lease to the Gackwar. A copy of his answer was transmitted to Colonel Close, the Resident at Poona, and from it he prepared in succession (to meet objections raised by the Peshwa) three distinct schedules of territories to be ceded. But Dhundooka, with Choora, Ranpoor and Gogo, are included in all of them, and in a memorandum dated December 21st the Governor writes—"Our having Petlad and Dhundooka will be of much political convenience, the former adjoining and immediately connected with Cambay and Dholka, and the other as including the two ports of Dholera and Gogo."

Next year Colonel Walker, Resident at Baroda, visited the Walker's Reports, page 14.

new cessions, and reported that the Grassias were "nearly on the footing of Moolukgiree tributaries, and required an annual armament to obtain payment of their Jumma," that they owed no obedience to the Government, and that as they paid tribute to the Gaekwar and Joonaghur Nuwah, as well as the Peshwa, it was not "an easy matter to point out the paramount power."

Colonel Walker distinctly says that as the Mahrattas had never interfered with the jurisdictions of the Grassias, they could not be at once considered subject to British jurisdiction; and he

Compute the Highlin ler in the seventeenth and eighteenth centuries—Macaulay, ch. XIII 'Many minature courts, in each of which a petty prince, attended by guards, by aumoun-heaters, by musicians, by a hereditary poet laureate, kept a rude State, dispensed a rude justice, waged wars, and concluded treaties."

thought they could only come under it by their own voluntary Act. "An attempt to give them our laws against their will would not, perhaps, be just, and would not answer the purpose." He proposed to obtain from each individual Grassia a cession of jurisdiction like that of Dholera—"Our first en-

deavour should be bent to obtain from them acknowledgments in writing expressive of their submission as subjects to the English Government, and its laws and regulations. It is usual with

Grassias to give writings of the kind, and formally to transfer their rights in exchange for protection. Dholera is an example of this."

So tedious a method of assimilation was not approved. The administration of this early period is described in Regulation II. of 1805: "The two latter divisions (Dhundooka and Gogo) for the first two years remained in charge of the Resident of Baroda, with European Assistants and Native Officers, who during that period administered the police and justice of the country in ordinary cases (none of great magnitude. or of a capital nature, being decided) according to the local usages and the principles of equity. Meanwhile information was collected and preliminary steps pursued."

"When regular Collectors were appointed," Mr. Mountstuart Elphinstone continues, "the same system was for a long time pursued." It was now applied to Dholka also, which district had been ceded by the Gaekwar to defray the charges of a subsidy by a Sunnud dated June 6th, 1802, but arranged to take effect from A.D. 1803-1. The Thakore of Bhownuggur, who was at first specially exempted from British jurisdiction in his estate in Dhundooka and Gogo, forfeited the privilege by misconduct in

Macaulay, ch \III-' The ancient Gache polity hal been found in-

1813. And in 1815 the Honorable Court take occasion in a despatch compatible with the authority of to note their approval of the asserlaw, had obstructed the progress of tion of sovereign rights (of which many had previously doubted the

existence) throughout the whole of the cessions by the Treaty of Bassein to the west of the Gulf of Cambay. In 1819 the Honorable Court further resolved that the right of Government to increase the tribute payable by the Grassias naturally followed from the decision previously passed on the question of sovereignty. "The effect of that decision was to place these classes on the same footing as other subjects, and consequently to render their property liable to a proportionate share of the public burden."

In 1817, by the double cession on the Peshwa's part of the lordship and the Gaekwar's part of the tenancy of the farm of Ahmedabad, Veerumgam, with the remaining Talookdaree estates of the Choowal attached, became a British district.

Now between this time and 1821 it appears that the jurisdiction of our courts took firmer hold on these districts. The Thakore of Kôt was sent to prison for neglecting a summons, and the Chief of Patree was incarcerated for debt. The Collectors also were over-zealous. On the strength of the Honorable Court's decision, and with no data of production, in three years they made a vast addition to the Jumma. They also appointed Mookhees, and in Dholka even Tulatees to the Talookdars' villages, and they altered the principle of the Dholka payments from a tribute paid to Government to a certain proportion of the produce left to the Grassias.

The Honorable M Elphinstone saw and pitied. He had the Tulatees withdrawn, and lower-Minute of the 6th April 1821, Old selections, vol III.

He deprecated the extreme action of the Adawlut, and suggested some checks upon it. Finally, he proposed settlements of some length, instead of the yearly revision of Jumma.

As there is very little in the nature of authoritative decisions on record for many subsequent years, it is worth while to consider at this point what the condition of the Grassias ought to have been found to be when it again attracted the special attention of Government.

The question of jurisdiction had been settled, and so had that of increasing the tribute or Jumma. But a principle had been laid down about the latter. The Honorable Court decided that the Grassias were not aliens contributing a fixed subsidy to a foreign power, but subjects whose property was chargeable with a share of the cost of Government in proportion to that borne by other classes. If so, it is natural to ask how the mercantile classes tharged with their share now that the Income Tax is disconticed, and why the Grassias should have been charged with Income Tax when they paid a property tax already. Although,

however, the subsequent practice unquestionably goes much beyond the principle laid down by the Honorable Court, still it may be fairly put that the Grassias always had paid a property tax under the Mogul and Mahratta, that the amount of it was never fixed, and that, although the increase under British rule has been great, it is not out of proportion to the increased value of the property, which has resulted from good government. The Grassias, in short, do not bear an inordinate share of the public charges, although they may be entitled to complain that certain classes do not bear any share at all.

But it is most important to mark that the Honorable Court assert no other claim upon the landed property of the Grassias than the common liability to a quota of the cost of Government. The excellent authority of Colonel Walker and Mr. Elphinstone establishes that up to 1821 this view was not only correct, but universally admitted, and no special note of it is necessary but for the strange inconsistency of subsequent opinions.

It had been settled then that the Talookdars were proprietors paying their share in the public burden by a tax on the value of their land. They were possessed of the common right of letting their lands at pleasure, and their ryots were their tenants-at-will. They were consulted on the appointment of their village police officers, and Government did not assert any right of entry upon their estates to measure or assess their lands. Estimates of the value of the standing crops were made by the District Officers, but Mr. Elphinstone's rule (that the Jumma should only be increased on an increase of the Grassia's means) was commonly respected, and, as prices fell continuously at this time for more than a whole generation, the increases of Jumma were not considerable. The Jumma was often unequal, but this was incidental to the method of fixing it without certain data of the value of the property. Altogether with the practice of the period between 1821 and 1860 the Talookdars have not much reason to quarrel. But they were in imminent and growing danger from a theory.

It is not easy to trace the sources of an erroneous theory which gathered volume from neglect as much as anything else. It

seems that in 1829 Government pointed out that the Kusbatee Bapoo Meea was, as Colonel Walker had explained in A. D. 1805,

Reports, page 39.

not a proprietor. Being embarrassed by debt and unable to extricate his affairs, Bapoo Meia was causing infinite trouble, and on referring to his history it appeared that he had no such claims as his Rajpoot neighbours to the protection of Government. "His family have held, not as proprietors, but by sufferance of Government, lands the whole history of which (and it does not commence at a very remote period) shows they are resumable at the will of the sovereign." To refer to this as an authoritative decision on the rights of Grassias is a manifest blunder, but it has been frequently so referred to, and probably with a feeling of satisfaction, for the Grassias shortly came to be viewed with little favour in the eyes of the Zillah officers, and not perhaps without reason.

The Grassias are indeed not punctual, nor provident, payers of revenue. The system in force called for little intercourse with them, except in the way of attachments for default of Jumma. Years of famine plunged them into debt. Prices fell steadily. The Grassias spent largely as usual on weddings and funerals. They had long been a privileged class, against whom creditors had no remedy. Of the kind of obligation incurred by signing bonds on stamped paper they had had no experience. A few sharp visitations of the Civil process intimidated them into needless pliability. When summoned to the courts they either ignored the summons to their own discomfiture, or compromised matters with their creditor at a monstrous sacrifice. Money-lenders collected and became the terror of the district. Bond was heaped upon bond until the original transactions were lost in a maze of chicanery. Then came the recklessness of men who knew nothing of their own affairs, except that they were inextricably involved.

The Revenue Survey system was now (A. D. 1850-60) opening in other districts a new vista of prosperity and well-being to the ryot. If the Talookdaree ryots could be found entitled to a like entities enem, all would be well. If the Grassia could be shown to be in some sense a middleman or farmer, a proprietory right

might be inferred to be latent in the ryot. There were middlemen Talookdars in the North-West, and why not in Guzerat? It was forgotten that the name of "Talookdar" was first applied in Guzerat by the British themselves. It was not thought worth while to enquire as to precedent, or to question the ryots themselves, who consistently declared themselves tenants-at-will. It was overlooked that no trace of a contract, or other formation of a farmer's tenure, could be discovered. But it could not be denied that the Grassias held under leases, and when these leases had been submitted to the Law Officers of Government their opinion seemed to settle the question.

These formidable leases had begun in a very simple form. Grassias had always been used to hand in annual agreements for their Jumma. In 1821, when Mr. Elphinstone introduced the system of settlements for seven or more years, agreements were prepared for seven or more years. But these agreements were convenient places for embodying stipulations with the Grassias, and the original simple form was gradually expanded into a formidable instrument, which a Grassia could not execute without signing away many of his rights.

In course of time one of these agreements with ten or twelve conditional clauses was submitted to the Remembrancer for Legal Affairs. He was not told that the Grassias had immemorial possession when the "lease" was tendered, nor that it was devised and agreed to by the tendering party only. He replied that "the

Legal Remembrancer to Government, No. 124 of 1855.

legal rights of Talookdars are defined by their leases, the provisions of which are so stringent as to make

the Talookdar little better than a tenant-at-will of Government." From this moment all the peculiar rights of the Talookdars were theoretically abolished, and so they continued as long as Government consented to benefit by their own tort.

But in the quarters most practically concerned quite a different view was acted on. The creditors were now hastening to close upon the Grassias and have done with them. They called upon the civil courts to sell the Talookdars' landed property in

satisfaction of their decrees, and the courts held that it might be sold. The Collector, strange to say, made no opposition. Not only fields but whole villages were put up for auction, and knocked down for a trifle to the creditors or their agents. And yet when creditors applied to the Collector's Registers for an extract of the revenue of a Talookdar's estate and his interest therein, the Circular Order dated Jane 2, 1860. Mamlutdars were instructed to reply that the management merely was in the Talookdar's hands as long as it should be the pleasure of Government to continue it, but that Government were the abso-

A crisis of confusion was thus rapidly approaching. The decision of the executive was in conflict with the practice of the courts. Government had laid down rules on the "Middleman" theory, the enforcing of which might have caused a revolution.

lute lords thereof.\*

\*At Bhownuggur. An occasion came for testing them, and they were superseded.\* It was assumed that the ryots had proprietory rights, and the ryots denied it. If the Grassias should contest the question of ownership with Government in the civil courts and defeat them, the sales would be more numerous than ever, but this was most inexpedient, for the prices got were nominal, and an attempt by the purchaser

<sup>\*</sup>The following are some of the sales of villages which were held by order of the courts shortly before the adoption of remedial measures:—

to take possession would have resulted in a breach of the peace. The value of the estates, and the bearing of the Jumma on them, was quite uncertain. The amount of the encumbrances was equally uncertain, but known to be enormous. But on what were they secured? If the Talookdars had signed the leases presented to them, and thereby accepted the conditions, they were in fact lease-holders, and the hold of the creditors upon their landed estates was very nearly worthless.

It was suggested\* that Regulation XXV. of 1827 would meet the emergency. But could it be By the Government of India. applied to lease-holders? It was competent to Government no doubt by declaration to admit the proprietory right, but if this was followed by a general pressure of the creditors of many hundred estates how was provision to be made for the management of all these, in the words of the Law, "by the Officers of Government in the Revenue Department." Regulation were applied in a few cases, and the creditors combined in abstaining from stating their claims, there was no power to compel them to come forward, and the proceedings might be hopelessly protracted. Again, if the creditors had lent their money on the security of the profits of a lease, what was the value of their claims if the leasehold should be enlarged into full proprietorship? Was their security improved or abolished?

An enactment was devised, therefore, in the Legislative Council of Bombay, which should begin by reciting the facts as to the leasehold, and, after providing for a settlement of present liabilities, should make a reinvestment of proprietary rights its final provision. It was so framed as to leave creditors no option in consenting to an immediate and definite settlement, but full powers were left to the Governor in Council to make the settlement as liberal as circumstances might allow. The method of making awards on the claims of creditors was fixed by Rules appended to the Act, which were so calculated as to award the whole claim wherever it was fair and reasonable, and to cut off the excess from such as were extortionate. If the circumstances of the Talookdar should not be such

<sup>\*</sup>Wanta—Sue appended memorandum. as to call for any abatement, or if the loan were secured on freehold,\*

not on leasehold property, power was given to the Governor in Council to award all or any claim to be satisfied according to the terms of the deed or decree.

This Act was No. VI. of 1862 of the Bombay Legislature. It was put into force in the beginning of 1863, and applied in that year to 55 villages, principally of Dhundooka and Dholka, against which 1,069 claims were preferred to the aggregate amount of Rupees 12,76,559, and Rupees 7,00,411 awarded. In 1864 the Act was put into force in 116½ villages, against which 653 claims were preferred to the aggregate amount of Rupees 9,71,830, and Rupees 5,22,715 awarded. The debts of two considerable Talookdars, besides the above, have been settled by arbitration, the amount claimed being Rupees 2,60,130, and the award Rupees 1,69,656. The total of debt disposed of is therefore—

By Act VI...... 22,48,389 By Arbitration..... 2,60,130

25,08,519

or over a quarter of a million sterling. There are now, probably, very few estates remaining to which the Act need be applied. It is not meant that none of the Talookdars of the remaining villages are in debt. But they are safe from persecution, and in a good position to compound with their creditors. They have had funds provided by the wonderful prices of produce in 1862 and 1863, and they are required to purge themselves from debt before Government emancipate them from the leasehold.

The method of recovering these awards was arranged with due regard to the self-respect of the Talookdars, and to economy and despatch. It was not feasible to manage some hundreds of square miles direct, and therefore the rental was estimated, and a fair sum fixed yearly for the Talookdar to pay, the management not being taken from him, except in case of misconduct. It was also suffested by the Government of India, in order to mitigate the stringency of the Act, that the awards should be paid at once by an advance from the Treasury where the estate was not too heavily, encumbered. Advances were sanctioned up to the limit

of 4½ lacs, and it was ruled (under Section VI.) that they should be chargeable, until recovered, with interest at 5 per cent. per annum.

Up to the 1st June 1865, on which day the yearly accounts are made up, Rupees 3,03,157 had been paid off by advances, and Rupees 3,64,640 from collections, making a total of Rupees 6,67,797 paid off out of Rupees 11,23,126, the total award. Of the advances Rupees 30,574 had been recovered up to the same date.

It is a singular feature of this settlement that scarcely had the Act become law when the prices of produce, which had for some time been rising, sprang up at once to an abnormal height in consequence of the demand for cotton. The old price of a

\* 40 lbs. maund\* of Kala (uncleaned cotton) was 11 Rupees, but in 1863 many

of the Dhundooka Talookdars got Rupees 6. Food grains were sold in some places at Rupees 3 per maund. As the Jumma was not increased, and the Talookdar generally grows enough of food produce for his own supply, and spends little on other commodities, the rise in prices was very nearly all profit to him, and would have so continued for many years if the high rates had been maintained. But the brief gleam of incredible prosperity was very useful for the purposes of Act VI., as may be easily believed from the large amount of debt already paid off. Yet, from experience with Talookdars not brought under the Act until after the season of 1863, it is proved that this great resource would have been wasted and not applied to the liquidation of debt if it had not been directed aright by the controlling powers of the Act, to which the creditors ought to feel greatly obliged for compelling numbers of unwilling Talookdars to pay their debts without any cost for legal proceedings.

Another happy effect was that Government were conscientiously enabled to augment the awards to an extent which could never have been expected, and which left most of the creditors nothing to desire. Of 1277 claims it was decided to pay off 392 in full, and of these 247 had been paid off before June 1865. And thus those provisions of the Act which had fallen under much

unfavorable criticism before it was enforced were rectified by the felicitous accident of after events, while the result, which was always admitted to be desirable, and even necessary, at any sacrifice, has been achieved without the sacrifice of any thing. The estates have been disencumbered, and the Talookdars are still in possession of them.

Before the Act was put into force the Government of Bombay remarked—"In whatever manner the settlement (of debt) is effected, the first and most important measure to

be adopted will be to ascertain the capabilities of each estate; and as there are no correct accounts on the records of Government of the value of the estates, this information has yet to be acquired." The first step was "a survey of each property, and a classification of its productive powers in accordance with the principles of the survey." And next "the several estates having been surveyed and classified, the next measure will be to settle on equitable terms the amount to be paid by the Talookdars during the term of settlement as the Government Jumma. The settlement now to be made should not be made to depend on the amount of former payments, but on calculations based on the productive power of the estates, as ascertained by the survey classification and assessment." These instructions introduced quite a new principle into the assessment of the Jumma, and entailed an acquaintance with the internal economy of Talookdars' villages which had never before been attempted.

Indeed, a great part of these districts was virgin soil to a Revenue Survey. Even the Minister of Akber only surveyed Dholka, the nearest of the four to Ahmedabad. The "old survey" (1820—24) laid down the boundaries of the estates in Dholka and Verumgam. Those in Dhundooka and Gogo had never been visited by any survey, except some few which had fallen under attachment after the commencement of the new survey in the adjoining districts.

It will be remembered that Government did not formerly assert any right of entry on these estates for the purposes of survey

and assessment, and probably had no legal right to such entry in the face of a long prescription until the enactment of Rule 9 under Act VI. of 1862 and Clause 4 of Act I. of 1865. It is important to note this, because it marks the fact that the Jumma was not previously assessed upon the land, but upon the rental of the land.

The proprietor of this rental is the Talookdar, or family of Talookdars. Only those estates are now held by a single Talook
\*dar, which form the domain of a Gadee, or Chieftainship. The

sons and sons' sons (Bhayat) of the incumbents of these Gadees. A village given from a Gadee to a younger son reverts to the Gadee if the younger son dies childless. But if he has five sons the village is divided at his death into five parts, his eldest son having with the Jhalas a double share, and with the Waghelas and

common, the strongest holding shares in the produce, and the weaker being put off with small Jivaces, or subsistence lands, to the promotion of perpetual quarreling. But the sharers are so numerous, and their influence so divided and uncertain, that there is no. where among them any thing that can be called a Gadee, except perhaps at Bhunkora.

The Chief of Kutosun in the Mhyee Kanta, and the Chiefs of Limree, Wudwan, Wankaneer, Wullah and Lathee, in Katheewar, have estates in the Talookdaree districts; so also had the Thakore of Bhownuggur until the recent transfer to Katheewar. The

Macaulay, chapter XIII.—Mac-Collum More after MacCollum More, had with unwearied, unscrupulous, and unrelenting ambition, annexed mountain after mountain, and island after island, to the original domains of his bouse.

greater part of the estates of Bhownuggur and Limree are not their original property, but villages belonging to Choorasumas, Kathees, or their own Bhayat, made over to their their

protection or loans. In the former case (protection) the Durbars are probably safe under the statute of limitations, but where sixty years have not yet expired since a mortgage was made, or acknowledged in writing, the original owners may yet recover their villages. The Bhownuggur Durbar puts forward Section V. of Regulation V. of 1827, but that section (if still in force?) only protects lands acquired before the treaty of Bassein, and still held under a title conconferring a bona fide right to property, and not, therefore, lands held on mortgage. It seems clear that Act VI. may be applied to estates proved to be held on mortage made, or duly acknowledged, less than sixty years since, so as to restore them to the former proprietors after admitting any money claims proved against them. But clear proof of a mortgage is required to distinguish these from cessions for protection, and clear proof is seldom to be had. Grassias hardly over kept counterparts of Deeds, and the originals are with those most concerned to conceal them. The relief which it is possible to give to original holders (Mool Gametees) is, therefore, small. This would not much matter if they were safe in the enjoyment of the lands and fourth share, which they invariably reserved when mortgaging their villages. Unhappily, their position has invited aggression, and they have often been the victims of painful injustice, for which a remedy is to be had only in the civil courts, and for this they have not the means.

The community of a Talookdan's village consists of the Talookdar or Talookdars (commonly called the Durbar): his attendants, who are commonly Rajpoots of the Choowan, Rathor, Purmar, or other such clan; one or two shopkeepers, with whom the Talookdar has an account for petty supplies—perhaps a Gosace or Charun; the Mookhee, whom the Talookdar nominates under approval; the Havildar, who helps the Mookhee, and looks after the crops in the grain-yard; the village Barber, Puggee, and others; and the cultivators, of whom a few are Koonbees, and the rest Kolees, Burwars, Aheers, and such like. There are no hereditary village officers, and the name even of Patel is unknown, except in Dholka.

The Durbar is highly regarded even in its eccentricities and follies, and no one holds any station in the village but by its pleasure. The summary jurisdiction of the eighteenth century has not been entirely

forgotten. It is more than suspected that some of the Gadees have occasionally revived the feudal powers which the laws have superseded, and it seems a sound policy which has lately invested some of the best qualified Thakores with magisterial powers, and a personal interest in upholding the law.

The village site is, like the rest of the lands, the property of the Durbar, and the wooden frames of the buildings (which are probably cut on the village lands) are also the perquisite of the Durbar when the tenant leaves the village. There is often an exception to this rule in favor of Brahmins, &c. It savours of the time when all the houses were of mud, and the wood-work only valuable. Certain cesses of the nature of ground rents were abolished by Act XIX. of 1844, one of the most indiscriminating Laws ever passed. It would be very expedient to revive the ground-rents to form a fund for village municipal purposes.

All the village lands pay rent to the Talookdar, except such as he, or his ancestors, may have given away. Of the latter class some part has been given absolutely to Temples, Brahmins, or Charuns, and the rest is enjoyed by the village servants as their wages, and often pays a cess or quit-rent. Of the rent-paying (Durbaree) lands the Talookdars mostly keep a portion in their own hands, cultivating it by their house-servants (Ghurkhed). The rest they let out to their tenantry, whose tenure is not secured by leases, or written conditions, but presumably is from year to year. Tenants sometimes give a bonus to get the occupation of a field, but this is an irregular proceeding incidental to large estates, and the money, probably, goes into a Karbharee's pocket.

The rents are everywhere, except in a few rare instances, paid in kind. It is more accurate to say that the Grassia goes and divides out the produce according to the custom of the village (Dharo). But there are different methods of doing this. In wheat and other food grains the common way is to make an estimate of the standing crop by cutting and weighing a few rows at fixed intervals, and so getting an average (Dhal). In cotton the more favored plan is to bring the produce to the village grain-yard, and divide it there (Mankhul).

The small variations of the Dharo are countless, but a general idea may be given of it. First, the cultivator is allowed for seeds in wheat 1 a maund per beegha, and in gram 1 of a maund.

This taken, the cultivator gets next grain equal to the pay of the extra labourers engaged for the harvest at the current rate; and thirdly, a cess called Purtharo (about 5 per cent. of the produce) to cover the wear and tear of stock. The Durbar has a similar cess called Mapoo (from 2½ to 5 per cent. of the produce) for interest on its capital expenditure. Lastly, the village servants, temples, &c., have their small perquisites, which amount to about 5 per cent. of the produce. After these deductions, the produce is commonly divided to landlord and tenant in equal shares. In villages where the landlord takes less than half he generally makes up by a Plough Tax (Santhee Vero), varying from 10 to 20 Rupecs per plough.

The tenant has the further advantage that if he raises garden produce, or even if he manures his field, the Talookdar allows for his extra outlay by taking one-fourth, or even one-eighth, of the produce, instead of half. He is also allowed the grass which grows on the side of his field, and in some villages grass from the Ber, gratis, and he has all the straw of his grain crop. If he takes up new ground he pays nothing or a quit-rent only for three years.

Of the expenses, therefore, the Talookdar alone sustains the Jumma (taxes), the Mookhee's pay (police), and all remuneration of village servants given in the shape of land. The tenant alone sustains nothing. Conjointly landlord and tenant defray from the returns (1) seed, (2) extra labor, (3) the part of the remuneration of the village scrvants paid in kind, (4) charities to temples, &c.

The tenant finds his own implements and cattle, but the interest has the capital (Purtharo) appears generally to be more the Grassia takes on his (Mapoo). In case of such a crop sugar-cane he gets an allowance for all the extra outlay, and a larger share of the produce.

The crops (except the common grains kept for food) are sold to travelling agents who visit the villages at the harvest season. The cost of removal falls on the buyer, but is duly considered in the price offered. The tenant is saved the trouble and anxiety of storing and selling more than his own share of the produce; he cannot be pressed for rent before the produce is realised, nor for a cash instalment before he has got his money from the buyer.

Such appear to be the principal advantages of the tenant under the Bhagbuttace system. It is very far from illiberal, and the abuses which have made it unpopular are not its inseparable The Talookdar, however, and all private landlords, attendants. have the misfortune to compete with a landlord in the State, who is more liberal than they can afford to be with justice to them-The survey rental is not a full rent, as is well known; and yet the Talookdars have managed to retain their tenants in spite of the competition of the Khalsa villages. The tenants, no doubt, like a system under which they have no connection with Government Officers. They are not, however, in a position to accumulate capital, and a poor district has no artificial resources to meet the caprice of the seasons. Thus one or two bad years bring the tenantry very low, and the plea that they have to pay little when they get little, and that their rent adjusts itself to a bad season, is not conclusive that they would not prosper better if their rents were fixed (whether in money or kind) for terms of years. But the tenants are as slow to believe this as the landlords, and it is hard to expect either of them to be eager after improvements which are still coldly regarded by English agriculturists.

It would, indeed, be a far greater boon to both landlords and tenants to secure the expenditure of a considerable capital on permanent improvements in these districts. The Grassias might do it, but it is hopeless to try to open their eyes to the fact. The districts suffer from drought, and the water is scarce, (1) because little falls, and (2) because that little is not secured. A systematic planting of trees would go far to improve the rain-fall, and the construction of locks and bunds would give a uniform value to villages which may now absolutely produce anything between

2,000 and 20,000 Rupees in any given year, according to the quality of the rain-fall. Much may be done by a sound administration of Local Funds, but the spirit of combination and foresight which should inspire the proprietors to make these improvements their own is not yet in existence. They suffer for it in this way, that while their Jumma is naturally based on an average year's profits it is hardly credible without experience what unmeasured barrenness a bad season entails. In two out of the three last years the Dholka estates have hardly had any rice crop at all, and in one of these the wheat, and in another the Khureef, crops were scarcely worth gathering.

The subject of introducing money rents has lately been discussed, and was thus finally disposed of by Her Majesty's Principal Secretary of State for India—"There

seems to be no necessity for any authoritative interference between the Talookdars and their tenants, who, it is stated, do not even claim any rights of occupancy, and whose payments to their landlord are made by a division of the crop according to a Dharo, or custom, which is said to be well understood and strictly observed by both parties. I shall, however, be glad to learn that arrangements have been made for gradually substituting payments in money for those in kind, especially in the larger Talookas, which are too extensive for the personal management of the Talookdar, as such a change would greatly tend to secure the ryot against the powers which must in such cases be entrusted to subordinate agents, by whom they are not unlikely to be occasionally abused." In fact, where a village is held by several sharers who have not more than two or three hundred acres a piece, or even where one Talookdar has a whole village, the Bhagbuttaee has the good effect of finding the landlords something to do, and tightening the bonds between them and their tenants. But the Talookdar of twenty villages is sure to have more evil influences about him than the Talookdar of one, and comes with feebler powers to heavier duties. It is not said in the Despatch how far Governare to interfere in introducing cash rentals, but Act I. of \* Test makes it legal to let the lands of attached estates on rentals based on the survey assessment. There is little doubt that rents at an advance of 50 per cent. on the survey rates, inexpensively collected and honestly accounted for, would equal or exceed any income got under Bhagbuttaee, and greatly improve the condition of the tenantry.

If the Bhagbuttace is not perfect, it has, however, the advantage of keeping the rents to a fixed standard. The tenant has not to fear the competition of the cottier system, and he knows that his landlord will not be helped by the Revenue Officers, nor by the

\*Custom of the village.—See Act I. of 1865, Section 41.

Civil Court, in exacting more than the Dharo\* allows. For his greater security the Dharo of every village, confirmed in the presence, and attested by the signatures, of both landlords and tenants, forms part of the record of the present settlement. As a matter of fact, exactions are rarely attempted;

and as long as a tenant conforms to the Dharo he is practically as safe as a cultivator in a Khalsa village.

He is, however, universally admitted to be a tenant from year to year. The tenants have never set up a claim to any better right, and it is very justly decided that there is "no necessity for any authoritative interference" on behalf of a class who are not suffering under any peculiar hardship, nor sensible of any ground of complaint. Besides the protection of their system, they are protected by the interest of their landlord, and against harsh and summary ejection they are protected also by the Law (Act I. of 1865, Section XLIII., chapters 1 and 2), which by requiring six months' notice of the termination of tenancy on either side gives time for sudden spite or enmity to subside, casual disputes to be arranged, and the mutual interest of the parties to be duly considered. In fact, the ejection of tenants is at present so very rare as to be quite unimportant.

Such are the acknowledged rights of the inhabitants of Talookdaree estates. The object of the survey of them com; menced in 1863 was (1) the valuation of them for the purposes of Act VI., and (2) the better settlement of the Jumma, or land revenue. It was necessary to make not a field survey, but a

distinct survey of each estate, that is, of as much land as is separately and indivisibly responsible for the debts of one person, or of two or more persons holding their land in common. Within this the largest block of uniform soil which could be conveniently measured and classed was taken as the unit of the survey. Roads and rivers were taken as boundaries of numbers, and the average size turned out to be about 40 acres in unenclosed country. Lands held by the Talookdar's servants or village functionaries were not separately measured, for these lands are his resumable property assigned for the wages of these people, instead of payments in money. They and the Durbaree lands are measured together as those on which the Talookdar's Jumma is assessed. On the lands given by him to Brahmins and others Jumma is not assessed, and for a further purpose these latter have been separately measured and classed.

The State has, of course, never had an opportunity of granting lands in Talookdaree villages. All such grants have been made by the Talookdars, and fall under Section 3 of Act VII. of 1863. They may be defined technically as all grants which the Talookdar, whether from the nature of the gift or lapse of time, cannot legally resume. In virtue of that section Government is not bound to respect these alienations by Talookdars if at any time compelled to assume the management of an estate. That is to say, on such an occasion the value of these lands would be liable to be taxed at the same rate as that of the Talookdar's own lands.

But as it did not appear that such alienations had hitherto been charged to the Jumma when estates were attached, nor included in the estimates of produce when the Jumma was fixed upon estimates, Government were pleased not to include these lands in those on whose value the Jumma is fixed in the present settlement. In order to limit this indulgence, however, to bond in three holdings it was necessary to record them, which had up to this time been done; and in consideration of the recogni-

tion and registration thus extended a charge of one-eighth of the

Government Resolution, Revenue Department, No. 1804, April 26th, 1864. assessment fixed on each such holding by the survey is imposed on the occupant, and collected and paid in by the Talookdar, who is

patron or grantor of the holding. Government consent to accept this lighter tax only on the alienations recorded at this settlement, and not on future ones, and the register of those found existing forms the register of recognized alienations by Talookdars at the settlement of 1863—6.

The alienations were thus disposed of, and it remained to shape a plan for assessing the Talookdar's own property. The object was to get rid of the inequality natural to settlements made on imperfect data, and to establish some kind of ratio of assessment to value for general adoption. The value of the estate has always been an important element in calculating a Talookdar's Jumma, and it appeared that some point in the scale of the usual Khalsa survey assessment below the full rate might be found to form a This point might be determined by finding what fair standard. amount of the survey assessment was equal to a Jumma fixed at a fair increase on the previous Jumma of the greatest number of estates, and it seemed that if the Jumma was fixed between 50 and . 70 per cent. of the survey rates (as the assessed estate is more or less prosperous) it would give scope for a tair increase on the old Jumma, such as the improved prospects of agriculture warranted. It was settled, therefore, that the Jumma of Talookdars is to be not more than 70, nor less than 50, per cent. of the survey rates. Some estates already assessed above the maximum were reduced to it, and others were so far below it that they cannot judiciously be raised at once to the minimum, but the bulk of the villages have for the first time the advantage of a land tax fixed on a clear and equable principle. It should, of course, be here kept carefully in mind that neither 70 per cent, nor any other proportion of the survey rates, has any intrinsic propriety, but that the survey assessment has merely been called in to gauge the value of the estates, so as to bring the Jumma of each to one and the same proportion of the value.

The field work of the survey of the whole four districts was carried out by one Measuring and half a Classing Establishment\* between January 1863 and March 1866. The cost was under one anna per acre. The new settlements were partly introduced in 1864-5 and completed in 1865-6.

The new Jumma Kurar, or agreement, (looking to past experience the term "lease" should be carefully avoided) contains nothing injurious to the rights of the Talookdars. It is rather explanatory than anything else, more particularly in regard to the alienations, the service assignments, and the Talookdar's duties connected with his village police. All foreign matter not relating to his landed property and the lawful charges on it has been removed.

The object of all the proceedings which have been here described was the restoration of an ancient class of lauded proprietors. In order to give the fullest authority to the re-establishment of their proprietory rights, Government were pleased to provide in Section XX. of the Talookdaree Act that the Talookdar, when once more free from embarrassments, should "be the absolute proprietor of his landed estates." As the work proceeded it was noted that there were some estates, a not unimportant minority, which, from better management or better luck, were not in want of the relief which the Act supplied. That the favour which had been extended to the embarrassed should not by an accident be refused to the

\*Revenue Department, No 3975, Government\* that the introduction of the new Jumma settlement should be the occasion chosen for declaring that the lease-hold of the latter is ended, and the ancient rights of the Grassias established once more. "His Excellency in Council desires the delivery of agreements to be of itself sufficient proof of the recognition of proprietorship," and no restriction has been attached to this recognition, except in cases where there is reason to suppose that unliquidated debt exists. In these the agreement will be simply withheld until the Talookdar shall have emancipated himself.

And for the future protection of the new proprietory body, it is further provided that "a Talooka, or portion of a Talooka, is not to be sold for arrears of Jumma, except as a last resource to collect the Government dues, and that when the present work of the Settlement Officer under Act VI. has been completed, no such sales shall be finally carried out, except with the previous sanction of the Revenue Commissioner."

As a yet further protection, it was also ordered "that all sales of Talookdarce estates, or portions thereof, in the Ahmedabad district shall be conducted by the Collector, on the requisition of the Court, under Section 248 of the Civil Procedure Code, and the Collector will then consider whether the provisions of section 244 of the same Code may not be applied to stay the sale and satisfy the decrees by other means."

With the long decline of agricultural prosperity arrested and reversed, with the old incubus of debt removed, with all their ancestral rights acknowledged and confirmed, with all reasonable protection to their property, with improved domestic habits, under an intelligible revenue settlement and thoughtful and sympathetic superintendence, with a vast expansion of the opportunities of education and of the means of transit, the restoration of the Talookdars is no longer a hopeless task. It may, perhaps, be conceded that the past three years have not been without substantial results, nor without promise for the future in the readiness shown by the Talookdars to admit the possibility of better things. If progress seems slow, it may yet be remembered that the fruits of these operations will appear chiefly in the next generation, and the work of the present day is patiently to keep alive and extend the little growth of hope which has succeeded to so many years of barrenness.

6th June 1866.

## APPENDIX.

## FORM OF JUMMA AGREEMENT USED IN THE TALOOK-DAREE SETTLEMENT OF 1863—6.

The Sircar is pleased to agree with you for the Jumma of your

village of \_\_\_\_\_for 23 years, from Sumvut 1921 to Sumvut 1944.

OF THE VILLAGE OF ---

To the Manager (Wywutdar) and all the Sharers

The terms of this agreement are as follows:-

for the management.

to pay the Jumma of it.

1. You shall pay to the Sircar the full sum (গ্ৰ আছিটা) due, Rupees ————, yearly in the following instalments:
2. In this sum (આંકડા) there are three items (રેકમા). The detail of these (તેઓ ની તપશીલ)—
1—The Jumma of your Durbarce lands to be paid by you is Rupees———.
II—The Sunudee Salamce on your alienated lands, as per Yadee appended, is Rupces————. This you will collect from the alienated land-holders.
III—An Improvement Fund (શુધારાના કર) at the rate of one Anna for every Rupee of your Jumma. Of this you are to pay Rupees ————, and the alienated land-holders Rupees —————, as shown (આશાંત્રીવાર) in the appended Yadeo.

3. If any Sharer shall fuil to pay his Jumma Government will give over the management of such share to the other Sharers until satisfaction shall be given to the Sircar that good management will be observed in future. The Sharers will manage such share and satisfy the Government demand thereon, and pay the owner the balance, if any, after deducting expenses (41 & & d) and 10 per cent.

4. The Jumma of each Sharer is fixed according to the land in his possession. He who holds the land will be required in every case

- 5. Whoever shall be appointed Manager (Wywutdar) by Government shall collect the Jumma from all the Sharers. Those Sharers whose names are entered in the Sircar's books shall be answerable to the Manager (Wywutdar) for the Jumma of their sub-sharers (Peta Bhagdars), and the Manager (Wywutdar) shall be answerable to the Sircar.
- 6. Every Sharer shall be responsible for the repair and good orders of the survey boundary marks on his own land.
- 7. The Sircar has not fixed, during the currency of this lease, any higher Jumma on account of Bagayet cultivation. You should, therefore, increase such cultivation by every means in your power.
- 8. The Sircar does not interfere in the management of your villages, but you must agree to conform to the following clauses:—
  - I—You are answerable for the prevention of theft and disorder in your village. You are required to give attention to this duty yourselves, and you are also required to pay such Police Establishment as the Sircar thinks proper for this service. If you do not, the Sircar will add the money to the Jumma and pay them direct.
  - II—You are responsible for the village expenses, and you bear them, according to custom, by giving land or money. You should arrange these expenses according to the size of your village, and if you find more land to be alienated for service than what is required you should take rent from the surplus that you may not suffer loss.
  - III—The Sircar has made a separate settlement of the alienations you have made up to this day. In future if you alienate land the Sircar will still continue to take such land into account in fixing your Jumma, so that if you give away land the Sircar's Jumma for such lands will still be levied from you.
- 9. The Improvement Fund will be expended on works and schools, which will profit your estate, and be of use to the people thereof. You are, therefore, not to consider that it is an enhancement of your Jumma.
- 10. This agreement is made certain for twenty-three years, in ter that you may exert yourselves with confidence in the improve-

ment of your estate. At the end of that period according to the good condition of your cultivators will be the favour of Government towards you.

Signed, in token of agreement,

Wywutdar.

Settlement Officer.

Chief Sharers.

## DHARO, OR SYSTEM OF CROP PARTITION BETWEEN LANDLORD AND TENANT IN A DHUNDOOKA VILLAGE.

1. In Khureer Crors—Jar, Bajree, Buntee, Mug, Mut, and other common food grains.

Rule for Mankhul, i. e. where the produce is brought and divided in the grain-yard—

### I-Tenant's perquestes-

- (a) Pay in kind of the labourers employed for reaping (less one labourer) at the rate of wages at the time.
- (b) Purtharo (interest on tenant's capital invested in stock) two scers in every maund (5 per cent. of the whole produce).

II—Durbar's perquisites.—Mapoo (interest on the Grassia's capital expenditure), one seer in every maund (2½ per cent. of the whole produce).

- III—Village perquisites.—For every 10 maunds—
  - 6 Scers for Potter...... 6 Scers Thakore Mundeer.
  - 6 Seers for Puggee ..... 6 Seers Waneo.
  - 6 Seers for Bungio ..... (about 5 per cent.)

After these deductions the grain is thus divided-

If the tenants are the Grassia's relatives, Rajpoots or Charuns, the Durbar has one-third and the tenant two-thirds.

If the tenants are Kolees, Bhurwars, &c., the Durbar has half, and the tenant half.

If a tenant manures his field, only a third is taken from him for three years, afid after that according to the usual Dharo.

Rule for Dhal, when an estimate is made of the standing crop.

—No perquisites are taken, and the grain is divided in the proportions shown above.

#### 2 In Rubble Crops—cotton, wheat, gram

I—Gram.—In case of Mankhul, perquisites as above in Khureef, and besides, seed is allowed to the tenant thus. He is allowed the equivalent in grain at the time of reaping of the price of five Bengal seers per beegha at the time of sowing (that being the amount he is presumed to sow). If there is not enough produce to repay the seed one year, it is given in the next The grain is then divided as in Khureef.

In case of Dhal the seed only is deducted (no perquisites), and the grain is divided as above.

Linear Crop Wheat—In case of Mankhul perquisites, as in Khureef seed, at 10 seers (Bengalee) per beegha estimated as above. Division of grain as above

In case of Dhal no perquisites, but seed. Division as above

III—Cotton — In case of Mankhul, tenant's and Durbar's perquisites as in Khureef Village perquisites three seers, instead of six. Partition of produce in the same shares as Khureef.

In case of Dhal no perquisites are taken.

IV—Irrigated Wheat —Seed is allowed at two maunds for every beegha, and the Durbar's share is one-fourth and the tenant's three-fourths

V-Sugar-canc.—The following perquisites are deducted:—

1—Tenant's perquisites—

Equivalent in sugar of cost of seed.

Ditto water-bag.
Ditto hire of pan.
Ditto feed of bullocks.
Supply of water.

Ditto cost of mill.

Ditto pay of boiling-man.

and as much sugar as they can make in three days and nights.

2-Durbar's perquisites-

Mapoo, at one seer per maund (2½ per cent). Koowur, half a maund for each water-bag. Royalty of well one maund ditto.

3—Village perquisites—Five seers each to Village Potter, Barber, Puggee, &c. &c.

After these deductions the produce is divided one-eighth to the Durbar, and seven-eighths to the tenant.

Lands waste over ten years are allowed for three years rent free to any one who takes them up.

Waste lands producing grass are rented out.

Burwars who keep cattle and do not cultivate are charged 15 annas per person as grazing fee.

If any other than the owner cultivate alienated lands they are charged 15 annas per field

#### MEMORANDUM ON KUSBATEES.

- 1. The Kusbatecs of the Ahmedabad Collectorate are of two races, viz. pure Mussulmans and Rajpoot Purmars, who became renegades. The Mussulmans are simply part of the influx of the conquerors from Delhi, the Purmars were one of the wandering Rajpoot tribes in very early times. They travelled from Aboo to Moolee in Kattywar, and while at that place one of their Chiefs was converted to Islam, and received from the Gujarati Emperor, Mahmud Begura (A. D. 1480), the gift of Ranpoor in Dhundooka. His younger brother followed his example, and received Botad in Dhundooka, which his family ultimately lost, and removed to Dholka, when they took service under the Mussulman Viceroys, and were ancestors of Bapoo and Mulick Meia, whose names are well known.
- 2. The Kusbatees now at Ranpoor thus received their lands as the gift of the Mussulman unquestionably, but it was a very recent conquest, and had just been taken from the maternal uncle (Ranjee Gohil) of the Purmar Chief, who was doubtless installed as a tributary. Chief, with the same rights as all others who have since become "Talookdars."

- service with the Mogul, and were on the same footing as the Delhi Kusbatees. Out of the six Kusbatee estates which the English Government found in Dholka three were held by Purmars (all of one family), and three by Delhi Mussulmans. In Veerumgam there were seventeen villages held by Delhi Mussulmans. These are the Kusbatees proper.
- 4. Their holdings are broadly distinguished from those of the Grassias and Mehwassees, inasmuch as they neither held in defiance of the Government, nor by deed of gift from it. In fact, their connection with the supreme power, in so far as it was authorised at all, was a contract. The Kusbatees were not connected with the villages before the contract, and they obtained nothing of the nature of a Sunnud to make the contract perpetual. On the contrary, Colonel Walker states that it was in the form of a lease, terminable at the end of a fixed number of years.
- 5. Thus the presence of Kusbatees always argues the previous presence of the supreme power, and this is fully supported by the history of the Gujarat Sultans. The regular paths of their arms are two. The first from Delhi down to the seat of Government at Ahmedabad, on which they came into collision with the Edur Chief; and the other from Ahmedabad towards Khandeish, passing through the Kaira Collectorate, and coming into collision with the Champaneer and Rajpeepla Chieftainships. Veerumgam and Dholka lay within the sweep of these marches, but Dhundooka and Gogo did not. The map of Kattywar in Revenue Selection No. XXXVII. will explain this at one glance.
- by the Moguls belongs to the subject of Wanta. In the earliest Dehjarra of which I am aware the whole prosperous villages are divided into three classes, viz. those still held by Rajpoot Grassias, those held by a variety of Officers in Manotee, and those held by the Government direct. The holders of the middle class are various. An Ameen and a Mujmoodar, one or two Delhi Mussulmans, and principally the Purmar Kusbatees, Futteh Mahomed and Ucha, representing the two branches of that family, which reunited in Bawa Meia. The villages so held by Bawa Meia at the beginning of British rule formed his Patockdarce estate, but there are numerous other villages then (and consequently since) Khalsa, which his family had once held on precisely the same terms.

- 7. Colonel Walker appears to have been perfectly well aware that there was no analogy between the holdings of the Grassias and those of the Kusbatees. He divides the latter into two kinds—1st, a leasehold from the Mahratta Government, and 2nd, a holding by private contract, of which the Government took no official cognizance. The first was of villages which had become waste, and the latter generally of Government villages unable to pay the demands of the farmer of the Purgunna. There should have been added, I think, some few villages mortgaged by their Grassia proprietors.
- 8. It should not be forgotten that in a. D. 1818 the principal Kusbatee of Dholka actually wished to resign the management of his estate on receipt of a pension, and would have done so but for the interested dissuasion of his agents. He was quite aware that his people neither ever were nor were fitted to be landed Chiefs. In that capacity they were victims of their Karbharees, who soon brought them to ruin.
- 9. I cannot refrain here from noticing again the ultimate opinion expressed by Government as to the holding of the principal Kushatee of Dholka. It is almost in the words of the late definitions of the Talookdaree tenure in general, and yet it is so at variance with the recorded opinions of the Officer whose signature is appended to it as to the rights of the Rajpoot Grassias, and so just a description of a very different class of rights, that I cannot conceive how the two became confused. The pith of the whole distinction is that the Grassia had maintained his rights hereditarily: the Kusbatee had taken his by contract recently. Government, therefore, say of the Kuspatee-" his family have held not as proprietors, but by sufferance of Government, lands, the whole history (and it does not commence at a very remote period) of which shows they are resumable at the will of the sovereign." If this were said of the Gametees of Dhundooka and Gogo, it would not be true. But they write with perfect truth of the Kusbatee-"Like the renter of a farm, the Talookdar (in this special case) has no right to continued possession. His right ceases when the period of settlement expires; or, in other words, he has no title

Government to Collector, September 80th, 1829.

to the produce till the settlement is renewed, and that may be so or not at the option of Government." Five years be-

fore the writer of this was describing the Gametees as "owners" and "small proprietors." It is impossible to believe that he had not these same holders in view when he said that the Dholka Manotedars had held "not as proprietors."

- 10. Less is known about the Veerumgam Kusbatees, but it is not less certain that the English Government found them holding "not as proprietors." They assert themselves that they came from Khorassan, and received their villages from the Waghela Kings of Puttun. In favour of this story there is to be said that one of these kings is recorded as having Mahomedan retainers. It is said that under the Mogul Government they paid a Jumma calculated on the produce, which shows that they were, at any rate, not in the first rank of independents. This continued under the Peshwa until A. D. 1804. when Babajee Apajee, the Gaekwar's officer, demanded of the Kusbatees a greater Jumma than they would consent to pay, and they were dispossessed during the whole of the second farm of Ahmedabad until A.D. 1814, when they were reinstated by the Peshwa's authorities. After this the management appears to have been sometimes with them and sometimes with the villagers, although mostly, under British rule, with the Kusbatces, until 1823, when the Collector was induced by their obvious incompetence to propose to Government a scheme by which they should retain nine villages and give up the rest. proposal was that they should be allowed such liberal terms as to make their profit on the remaining nine nearly as much as it had been on the whole seventeen. They had had twenty per cent. on the seventeen villages, and they were allowed not quite forty per cent. on the nine.
- The rental paid for the nine villages, in the first year of the new arrangement, was Rupees 1,925, and that paid in 1860 was Rupees 2,837. These liberal terms, however, and possession under any terms, were expressly stated to be continuable only "during the pleasure of Government. The consolidated privilege on the nine villages is no better in kind than the extended privilege over the seventeen."
- 11. There are four villages in the Matur Talooka of the Kaira Collectorate, which should be added to those under Ahmedabad, as being "Talookdaree" in the same sense as other Kusbatee villages; their names are Ruroo, Poonaj, Chandna and Koonjra, and I believe the merits of the claims of the Kusbatees on them is still the subject of discussion.
- 12. They are, however, simply part of the Dholka Kusbatees' estates, having all been at first in the Dholka Purgunnah. They shared the general fate of all Talookdaree estates as long as they were under Dholka, having their rentals fixed yearly very much at hazard, and in 1817-18 they were separated from the estates they belonged to and put under Kaira, just before the Collector first tried a rack-rent

of the Dholka Talookdaree estates, and then fixed the Talookdars' share at 20 at per cent. of the Rajbhag, and subsequently Government increased that proportion to 30 per cent. The above four villages went on under the old system until it occurred to Rapoo Meea, in A. D. 1834, to apply for the same terms in his one Kaira village as he enjoyed in his twenty-seven Ahmedabad ones. He never got the benefit of the change, as his whole estate was meantime made Khalsa, with a pension to him; but as the current leases of the other three villages fell in, 30 per cent. was reserved, and has been paid up to 1850 to the Kusbatees, although the management has been under Tulatees, as in Government villages.

- 13. The case of these villages, then, under British rule, is (except by caprice or accident) neither better nor worse than that of other Kusbatee villages. But I think that, if the Officers concerned had come to a fair understanding, the allowance of 30 per cent. granted after Bapoo Meca's petition would have been withheld.
- 14. In the correspondence which took place the Collector did not clearly explain how the villages came into the Kusbatce's hands; but the Revenue Commissioner, Mr. Williamson, in handing it up, and recommonding that the Ahmedabad settlement be extended to the Kaira villages, makes an exception if the villages prove to be held on nothing but leasehold. He says-"The Collector should take care, however, that villages which the Kushatees hold as simple tenures\* (with rights analogous to those of common Mutadars) should not be confounded with those to which the remarks in the preceding paragraphs apply;" that is, those to which the indulgence is to be extended. Now, it was Mr. Williamson also who, five years earlier, wrote the passage I have quoted in paragraph 9, and which begins-" Like the Mutadar of devillage, or the renter of a farm," the Talookdar (Bapoo Mcca) has "no right to continued possession." Surely, no more proof need be cited that he was debarring this spurious Talookdar from the privileges of hereditary Talookdars.
- 15. All these four villages were held with rights analogous to those of common Mutadars, as were also a large porportion of those in Dholka. It is easy to read the history of each by the tenures between which it is still divided, e. g.
  - 1. Ruroo.—There is a Wanta Ruroo paying an Oodhur or fixed Jumma, and a Tulpud Ruroo which Bapoo Meea held.

<sup>\*</sup> Query: Farmers or Tenants,

- The Wanta is held by a Rawul Rajpoot, evidently of the family which anciently possessed the sixty-six villages of Matur (Chascten), where members of it are still found. It is plain that the Rajpoot was dispossessed and assigned a Wanta by the Mogul Government; then in the confusion before the Mahratta rule began the Thakoor of Sanund got possession of Ruroo Tulpud, and from him it passed in some way unknown to the Kusbatees. The Muttadars of the village declare that it is properly Khalsa, and that the Kusbatee has no rights in it. The district records say that the village was held on farm by the Sanund Thakoor, and mortgaged by him to the Kusbatee.
  - 2. Chandra.—A Rawul or Gohil Rajpoot has Wanta in this village also, the history of which must resemble that of Ruroo. The village was restored when waste, and apparently mortgaged to an ancestor of the present Kusbatee, who, however, was simply a farmer on lease. The village appears as 'Khalsa' in Dehjarras written during their holding.
  - '3. Koonjra.—Some Waghela Rajpoots of Rasum, in Dholka, have Wanta in it; therefore the village must have been 'Khalsa' under the Mogul. The Kusbatees protected the Tulpud part of it, and actually acted as Patels for some time.
  - 4. Poonay.—No doubt, as stated, originally formed a part of the estate of the Thakore of Sanund. But there is a Charun or Rajpoot bard holding Wanta in it, so that the Mogul Government must have had the Tulpud part and the Sanund Thakor the Wanta, which he gave to the Charun. It passed to ancestors of the present holder simply as Munotedars, being entered as a Government village under their management as early as A. D. 1748. The actual holders, however, derived it by purchase from a relative as late as A. D. 1824-25.
- 16. All four villages, therefore, were once the property of Rajpoot Chieftains, who were expelled by the Moguls, and afterwards reinstated in a quarter of their villages (Wanta), either rent-free, or under Sulamee. The other parts of the villages since held by the Kusbatees were absolute crown-lands, and their rights are clearly of that unrecognised kind which Mr. Williamson considered as not vested in the land, but the management, like that of a village Officer.
- Now, examining into the history of the Dholka Kusbatee villages on the same principles, I find that out of forty-three villages had by them at the beginning of British rule thirty-one appear to

have been obtained in this same unrecognised manner. Of the other twelve (belonging to Bawa Mea), some are held on rather better title, having apparently been mortgaged by the Grassias to the Kusbatees many years before British rule, and others probably were taken up when waste and restored. The evidence on this subject is not very complete. There appears to be this difference, however, that in these twelve the Kusbatees formally undertook the part of quasi-proprietor or founder, instead of assuming that of Village Officer.

18. The principle of pensioning an incompetent Kusbatee, and resuming the estate of one who dies heirless, as pursued in Dholka, appears a perfectly fair and just one. That of allowing the full benefits of Talookdaree management (30 per cent) to Kusbatees, who have been discontinued in the management for good reasons, as pursued in the three Kaira villages, is unnecessarily liberal. It is also erroneous in principle; for being a reserved percentage of the produce it gives colour to the notion that the Kusbatees retain some right in the land, whereas their right is only to such consideration for long services as Government may please. A moderate fixed pension would meet the requirements of the case.

19. The estates continued in Kusbatee management are not very numerous. The following table (for Ahmedabad and Kaira) shows how they have been decreased:—

	1	2	3		4	
			M maged by	Government.	Managed by	Kusbatees.
	At the begin- ing of British Rule.		Man iged by Government during dis- puted suc- cession.	Ditto permanently allowing 30 per cent to lalookdar.	As superior holders under the Survey rates.	In hands of Eusbakes on fixed settle- ments or leases.
ESTATES	14	2	1	1	2	8
	(Including Chandna, in Kaira)	and part of another.		(also 2 villages belonging to Dholka Ta- lookdars).		•
VILLAGES	56	22	2	3	12	17

Nine of these villages are held by the Verungam Kusbatees under a kind of contract, the terms of which allow them 20 per cent of their receipts from the cultivator. 11 villages of Bapoo Meia's estate have

been given to his son, Sher Meia, as a superior holder, under the Survey rates; Luteef Khan, son of Muhmud Khan, has been allowed to succeed to his father's Talooka (8 villages), with the right of levying double the Survey rates; Jehangeer Meia holds his single village on the same terms as Shere Meia; the successor to the estate of \* Shere Khan (2 villages) has not yet been admitted to possession.

#### MEMORANDUM ON WANTA-LANDS.

I have described the Kusbatees and Wanta land-holders as beGeneral Report No. 62, paragraph 11.

belonging "rather to the privileged class
who existed by the countenance" of the
former Governments than to that which, like the Talookdars, successfully maintained their position against them. I have also shown how

Memorandum No. 65, of July
28th.

the Kusbatees may be described as quasiTalookdars. From the same point of view
the Wanta-holders proper may be called ex-Talookdars.

- 2. In the present day the term "Wanta" is used in Kattywar to denote the land which a proprietor reserves for his own subsistence when he sells his estate. It is understood to be free of all taxes. The important thing to observe is that it is essentially what remains to the owner of the soil, and not what he sells or assigns.
- 3. The well-known account of the origin of Wanta in Guzerat corresponds to this definition. The first Mahomedan invaders found the country partitioned out into estates of large or small Chiefs, whom they forcibly deprived of all but a fourth part, which took the name of "Wanta." The Wanta also was generally limited by a rentcharge, but not always on the same principle. From the Dustoor-ul-Umil of Todur Mull, the usage appears to have varied from the Baroda Sirkar,—where Wanta was rent-free "according to ancient rule,"—to the Ahmedabad Havelee, where it paid half as much as crown lands. In Thasra it paid a fixed tax; in Muhooda and Mehmudabad a fourth of the produce.
- 4. Of course, the Wanta of the present day is very different from that fixed by the Mogul. The Wanta-holders have none of them documentary titles, as far as experience has gone; and the limits of

The estates of Jehangeer Mela and Shere Khan have recently been resumed, pensions being allowed to the families of the Kushatees.

their holdings and payments must be accepted according to the first trustworthy record prepared under British rule. The present extent of this important alienation in the Khalsa villages of Ahmedabad and Kaira, as recorded in the Alienation Lists, will be perceptible from the following Table:—

1	2	ð	4	5
Collectorate.	Wanta.	Full ordinary	Other aliena- tions.	Full ordinary reatal value.
	Bergas.	Rs. a p	Becg 14.	Rs. a. p.
Ahmedabad	1,81,402 9 2	1,85 164 5 0	3,82,516 10 7	4,26,677 3 8
Kairá	83,350 4 15	185178 0 6	4,11,212 1 04	9,62,203 5 7

Every kind of alienated land, including service lands, is shown in column 4.

5. The following more detailed Tables, showing (1) the number of Khalsa villages in which Wanta is found, and (2) the amount of Wanta in the Khalsa villages of each Purgunua separately, afford matter for interesting observation —

- 6. From Table No. 2 it appears that the reserved rent-charge (or Sulamce) in Kaira is nearly twice as high as that in Ahmedabad,—that in the former being about 25, and that in the latter about 13 per cent. of an ordinary rental on the land.
- 7. The Wanta lands are, generally speaking, in the hands of Rajpoots of one or other of the clans enumerated in paragraph 13 of my general Report No. 62. The Kaira Wanta-holders are very mixed. Those in Ahmedabad generally lie in genealogical groups, as the Waghelas in Dholka and the Jhalas in Veerumgam. The main lump of Wanta is found in the hands of the hereditary proprietor, and' smaller parcels have been sold (Wechanioo), or mortgaged (Geranioo). or given for service (Chakurioo), by him or his ancestors. The Purgunnas may be regarded in groups, as to the history of their Wanta, with the Mogul stations of Ahmedabad and Kaira as their centre. Thus in Jetulpoor, Duskroee and Matur, the Wanta is smallest in proportion to the whole area of the villages, and most saddled with Sulamee. In Dholka, Veerumgam and Neriad, it is frequently above the traditionary fourth (apparently by subsequent usurpation), and very generally rent-free. In Kuppurwunj and Thasra it is found in a few villages only, and had perhaps some connection with the settlement of the Muleks in the latter Purgunna by a Sultan of Ahmedabad. It is rare also in Purantej, that Purgunna having formed part of the Eedur-wara, and not having been conquered in detail; while in Dhundooka and Gogo the torm was unknown previous to British rule,—a settlement after conquest having never been effected at all in those districts by the Mogul.
- 8. There is a class of Wanta-holdings presenting considerable differences from the ordinary aspect of these alienations to which my attention was directed by the Resolution of Government noted in the margin.
- 9. These are certain double villages, where not only the lands, but the village site is parted into two, of which one part is 'Wanta' and the other 'Tulput,' There are three of these villages in the Angedabad Collectorate, situated in the Dholka Purgunna, and the

two parts are each counted for a village in the accounts. To increase the anomaly, the Wanta portions are held by regular Talookdaree tenure. The following Table will supply all needful particulars about them:—

	Village.	Wanta Holder's Fumily.	Area of Tulput.	Area of Wanta.	Jumma of Wanta,
			Becgas.	Beegas.	Rs. a. p.
	Chundoesur	Rawul	2,716 2 0	4,333 7 5	1,051 0 0
1	Amliara	Waghela	3,723 17 3	819 10 18	260 8 4
	Waotha	Waghela	3,151 13 10	1,348 19 0	431 0 0

Villages of the same form are found in the Kaira Collectorate, of which I append a similar Table for the sake of illustration:—

Purgunna.	Village.	Wanta Holder's Family.	Area of Tulput.	Area of Wanta.	State dues of Wanta.
	Betasee	Mussulman Convert Purmar Mussulman Convert	Becgrs.  3,865-10 - 5  1,543 - 5 - 0  3,302 - 0 - 0	4,000 0 0	R <sub>5</sub> . a. p. 1,299 13 11 1,486 14 10 801 4 3
Mulioonda (	Kyurpoor Thamna	Goel	3,274 0 0	1,780 10 0 1,781 15 0	2,107 7 5 1,277 3 5

Matur	Rudoo	Rawul		2,082 5 0	685 5 0

Of these, Kijurpoor has only been divided since A. D. 1826, when a separate lease was given for the Wanta, which is now, however, paying a Beegotee revenue, and is only Wanta in name. It is said that the Gaikwar first imposed a rent-charge on the Wanta to the amount of one-fourth of the whole rental of the village. In Thamna, on the other hand, the Moguls first imposed a rent-charge, and the Mahrattas doubled it. In Kutwana both parts of the village are held under fixed State dues, and the Tulput part is held by Rajpoots. Probably, it was simply an estate divided between two brothers. In the rest of the villages the Wanta-holder pays fixed State dues, and his privilege

is referred back to the Mahomedan settlement. The Wanta has a distinct part of the village site, and distinct cultivators.

- Here then are a variety of phenomena with the same name. and a general resemblance. They serve to illustrate the hap-hazard management of the Mahrattas, who paid more regard to individual circumstances than broad principles Starting from the same origin. the Dholka Wanta villages met with treatment different from all of those in Kaira, but similar to that of the adjacent Talookdaree estates. The Mainlutdar reports in A p 1821 that there were once fifteen villages in which there where lands separate from the Crown lands, and paying a Sulamce Chundeesur was one of them, and paid 151 Rupees ' The Mahrattas, however, did not respect the privilege of fixed State dues, and in A D. 1766 Chundeesur Wanta paid 501 Rupees, and was shortly after treated as subject not to a Sulamce, or limited rentcharge, but to Juminabundy, or the full unprivileged share of State dues. At the beginning of British rule, in v p 1804, the Wanta village paid Rupees 1,188-1-11 The report does not mention the other two villages, but there can be no doubt that their history was precisely the same.
- 11. There is no reason apparent why the Mahrattas cancelled the privilege of the Wanta-holders, except perhaps in Chundeesur, the size of the Wanta, which was very probably augmented by usurpation. But the alteration took place so long ago that the Wanta-holders have now no claim whatever to the more privileged tenure. It only remains to consider the most convenient way of managing their holding under its peculiar circumstances.
- 12. I observe from the Survey Map of Chundeesur that the Wanta lands there are not intermingled with the Tulput. The whole of some 200 numbers which they comprise may be divided into four plots, each complete in its own ring-fence No inconvenience can arise from treating these farms held in a single hand as distinct from the other numbers, and the revenue transactions necessary with the holder will, if the State dues of Talookdars are settled on the basis of the Survey assessment, be of the very simplest description, as the field operations of the Survey have been already carried out. It appears to me that the three villages should be taxed to the same amount and treated on the same principle as the other Talookdares properties in Dholks.
  - 13. The part of the subject to which I now pass in connection

No 1651, of May 5th, 1860.

with the Resolution of Government noted in the margin is that which immediately

affects the existing Talookdars of certain Purgunnas, in whose estates are found Wanta lands quite distinct in character from the Jiwaee or sustenance lands given by a Talookdar to members of his family. This phenomenon has no place in Gogo, Dhundooka, or Purantej, for the reasons I have assigned In the Ahmedabad Collectorate it is peculiar to Dholka and Veerungam, and the extent of it is shown in the subjoined Table:—

Taloohdaree Villages in which Wanta is found.

Purgunna.	In possession of the Falookdar himself or his family	In possession of Rappoots of another clan in a lalookdaree village.	of Kampoots in	Of uncertain history	Total,
Dholka .	31	5	1	18	50
Verumgam .	G	11	2	8	- 22

- 14. I believe that the presence of these Wanta lands marks the course of a conquest much more complete than a superficial view would now suggest, and that no other theory will explain it. There is little doubt that the whole of the smaller Chiefs of Dholka were entirely, and the larger Chiefs partially, put down and pensioned off with Wanta, and it is a matter of tradition that the present Mehwassee country in Veerumgam once paid a regular rent (Tukseem Juma) to the Mogul. In latter days, when the Mogul empire fell to pieces, the Tulput part of the villages was seized either by the holders of the adjoining Wanta, or by new clans. In Dholka the Waghelas took back their own estates, but in Veerumgam the best share was won by a new clan, the Kolee Thakurras, at the beginning of the eighteenth century. In this district, therefore, the original Jhalas are the Wanta-holders, and the more recent Thakurras the Talookdars.
- 15. This is supported by the oldest extant revenue schedule of Dholka of the year A. D. 1748, in which only 77 villages are entered under the head of "Grassias," the rest being all under the head of "Munotee," or farmed, whereas there were 111 Talookdaree villages at the beginning of British rule; and of these 77, 4 more soon became Khalsa, 9 passed into the hands of Kusbatees, and several more fell; waste; while of the remainder, Wanta lands are now found in no less than 32, giving strong grounds for the belief that scarcely any

one Chief, except the Chief of Kôt (and he but partially), maintained his independence in Dholka. .

- by Chiefs to the younger branches of their family. But if so, I ask, why is it not found in Dhundooka and Gogo? And why is the Wanta in all the Gangur and Ootelia villages, some of the Sanund, and most of the petty Talookas, in the hands of the Chief himself? Wanta does not mean land assigned, but land retained. How then does it happen that the part retained is the smaller, and, as I shall show, tributary to the part resigned? How does it happen that the Wanta-holder and the Talookdar in the same village are sometimes of different clans? And how does it happen that in two adjoining villages Grassias of the same race hold Wanta lands, although the rest of the one village is Talookdaree, and of the other Khalsa?
- 17. I think it unquestionable that, although the original fourth of the village given as Wanta has been greatly encroached upon by the Magul in the near neighbourhood of the capital, and much increased by the Wanta-holders in more distant districts, the tenure, wherever it is found, is a trace of the old Mogul settlement. The Wanta, however, in Talookdarce estates has never under British rule been treated as separate from them, and any Sulamee derived from it has not been directly enjoyed by Government. I find that the usage has been various as to including the Wanta in estimates of produce formed by the Revenue Officers with a view to fixing rentals. Sometimes the whole produce was included, sometimes the Sulamee, and sometimes neither.
- 18. Sulamce, however, is paid by most of the Wanta-holders to the Talookdar of their village. In Veerumgam it appears to take the shape of a plough-tax, varying considerably in amount. In those villages where the Wanta is a property in separate hands this Sulamee must be treated as a charge on the property in favour of the Talookdar, established probably by force; and it is at least as respectable in its origin as the Giras cash-huks, which are supported by Government.
- 19. The date when such rent-charges were imposed would take us back to the convulsions out of which the present form of society emerged; and wherever they are found to be supported by the early resides or otherwise, the Wanta must be regarded as the joint project, of the Wanta-holder and the Talookdar. It is immaterial, however, as a revenue question, who the proprietors are, the Talookdar's Sulamee being in no sense a State charge or tax.

- 20. There seems to be a decided local feeling that Wanta was originally a tax-free grant. Wherever the Mogul Government saddled it with a Sulamee, the amount seems from the Dustoor-ul-Umil to have been declared and fixed at once, so that the grantee knew the amount of his estate from the first. And it appears to have been regarded by the holders as perfectly transferable, whether it lay in a Talookdaree village or a Khalsa. I may quote the case of Koowar, in Dholka, the Wanta in which has been sold by the holder (also Talookdar), and a separate hamlet built in it.
- 21. I am unable to see, therefore, how, without an enactment applicable to the subject, it is possible to interfere with the sale of any Wanta which is entered in the revenue accounts as such, on the plea that the right in it is not of a degree which permits alienation.
- 22. There are Schedules for Dholka and the Kusbatee villages of Vecrumgam, drawn up in A. D. 1820-21, which profess to give a detailed statement of the amount of Wanta in the Talookdarce estates. These, I believe, are the earliest complete authorities under British rule. In any villages for which no other statement than this has since been prepared, any claim in excess of the statement could be resisted by virtue of the undefined system pursued with the Talookdars. Attachment accounts will be found besides, in very many cases, which will establish the amount held in each case at some period during the last 30 years, and on what terms.
- 23. It may very plausibly be said that, where one quarter of the lands of a village is held rent-free, on the understanding that the other three become Crown property, it is a clear usurpation that the other three should now be held as private property. It is, however, an usurpation the origin of which is lost in the ruin of an extinct Government, and long antecedent to British rule.
- 24. When, however, the Wanta is held by the same man who holds the rest of the estate on Talookdarce tenure, the case is different. If such a person expects to retain the Wanta grant of the Mogul, he should be ready to resign the Tulput to Government. If he would retain the whole, he must expect to be subject to such State charges on the whole as are borne by other Talookdars. He established himself in his estate at the fall of the Mogul Government, and was subjected to his share of the expenses of the Mahratta Government along with the rest of his class and the town populations. He clearly himself erased the tradition of the original Mogul grant. I am unable, there

fore, to see any reason why, in such cases, the Wanta lands should be discriminated at all, or admitted to any other terms than the rest of the Talookdaree estate.

- 25. This view, if held correct, will limit considerably, and make it very easy to ascertain, the amount of Wanta in Talookdaree estates, which I would propose to treat in the same manner as the Wanta in Khalsa villages. Wherever the Wanta is held by the Talookdar, or members of his family, it should be specifically included in the terms of any contemplated enactment affecting the Talookdaree lands. Wanta held by entirely distinct parties (being an alienation, which Talookdaree lands are not), and bearing on its face the probability that it was a rent-free grant of the Mahomedan Government, should be identified in its treatment with the Wanta in Khalsa villages.
  - 26. It is in this latter aspect that Wanta is a privileged holding, as compared with Talookdarec estates. The owners of these estates were, from the first, heavily taxed, just as the owners of other property were taxed. The holders of alienations were exempted, according to their contract with the Government. As to ownership, I consider that the right of ownership in the best class of Talookdaree estate is quite as good as that in any Wanta, and the origin of it much more worthy of respect. As the land tax on them only became a special tax when the British Government abandoned the corresponding and equally heavy taxes on the trading part of the population, there was not in them even that limitation of ownership which in Wanta is constituted by the reservation of a rent-charge by the State (Sulamee).

# RULES MADE BY THE GOVERNOR IN COUNCIL UNDER SECTION VI. FOR CARRYING OUT ACT VI. OF 1862.

The Officer or Officers who are to be appointed under Section I. of the Act shall prepare the scheme mentioned in Section X. of the Act in the following manner:—

- 1. The Officer or Officers shall ascertain the principal sum originally lent by each of the creditors severally, and this sum with 9 per cent. For annum simple Interest from the time when the debt was incurred up to the date on which the declaration provided for in Section I of the Act shall be made, and no further, shall in each case bethe amount awarded, but subject to the following conditions:—
  - 1. The amount of Interest shall in no case exceed that of the principal.
  - II. The heir in the second generation of the person who originally incurred the debt to pay the principal only. and no Interest.
  - III. The amount assigned in settlement of bonds held for services rendered by the creditor, to be determined by the Settling Officer after hearing evidence of the service in question.
  - the satisfaction of the Settling Officer are not produced.
  - V. When the first principal is not satisfactorily proved, a deduction of 50 per cent. to be made from the amount of the debt as it stands at the first stage at which satisfactory proof of the existence of the debt is given.
    - VI. When no accounts are produced the claim shall be disallowed, unless the debtor acknowledges the receipt of a sum in cash, in which case that sum shall be treated as the principal of the debt, but no interest shall be allowed.
    - VII. Interest not to be allowed on account debts in the absence of any specification that it shall be allowed.
  - 2. All payments made by the Talookdar to any creditor, or profits which have been enjoyed by such creditor, towards the liquidation of any debt or liability before the settlement under the Act, shall be deducted from the principal sum of the said debt or liability, and

interest on an amount equal to such deducted sum shall be disallowed from the time of such payment or enjoyment; and the Settling Officer shall be competent to decide on the amount of profits realized under such enjoyment, after examining such proofs as are presented to him.

- 3. Whenever a bond, a decree, or other claim, has been transferred by sale, gift, or otherwise, from the original holder to any other person, the present holder shall be called upon to support his claim by the same proofs as if he were the original holder.
- 4. When profits or income arising from a Talookdar's estate have been divided into shares, and it has been customary to consider each share separately liable for the debts of the proprietor of that share, a separate settlement shall be made of the debts of each pharer, instead of for the whole estate.
- 5. All admitted debts shall be satisfied in the order of seniority) as they were incurred, except that money lent on the security of the estate shall be first repaid. Bonded debts also shall be satisfied before book accounts.
- 6. If the principal of all the debts, with simple interest at 9 per cent., shall exceed the amount which may be estimated to be available for the settlement of the creditors' claims, as provided for in Section VII. of the Act, during the period the estate shall be under management, then no interest shall be allowed on such debts as were not incurred by the present Talookdar. If the amount in the still in excess of the aforesaid amount, the rate of interest to be aware on the remaining debts shall be decreased until their amount falls within the required limit.
- 7. In deciding what claims are admissible for settlement, and what amount they shall be admitted, it shall be competent to the Settling Officer to appoint a Committee of experienced Natives, consisting of three persons, of whom one only shall be in the service of Government, to assist him, and it shall further be competent to the Settling Officer to reimburse the said Committee for their necessary expenses out of a percentage to be reserved on the rents and profits which the Settling Officer may receive to cover all charges arising directly from the special nature of his duties.
- 8. Provided, however, that if the creditors of any estate shall of themselves produce a Schedule of the original sums lent by them severally, signed by the debtor, and both parties shall consent to the

said Schedule in presence of the Settling Officer, it shall be competent to the said Officer to accept such Schedule without further investigation, and to make it the basis of his settlement.

- 9. During the period the estate may be under management, the Talookdar shall not, unless for special reasons to be reported to Government, be displaced from the internal management of his estate, but he shall, in regard to every thing relating to the said management, be subject to the supervision of the Settling Officer, who shall be fully authorized to take any steps which he may think advisable to ascertain and secure the full value of the yearly revenues of the estate or estates.
- 10. In the case of villages or lands held by superior Chiefs in virtue of mortgages or loan transactions, it shall be competent to the Settling Officer, with a view to avoiding undesirable agitation, to effect the compromise with regard to the possession of the village for the land which may meet the consent of both parties
- 11. Where Wanta lands which may be admitted by Government to be held as transferable property which the holder may charge or alienate, shall be found to have been at the passing of this Act in the bond fide possession and enjoyment of any mortgagee in satisfaction of any claims secured upon such lands, such unsatisfied claims shall be satisfied in full from the rents and profits of such lands on which they are secured text after any claims of Government on the said lands, and such amount as shall be proved and established under the foregoing rules.
- If the creditors shall agree to receive a sum of money from the comment Treasury in immediate satisfaction of all their claims on any estate, it shall be competent for the Officer appointed under Section 1 of the Act, with the sanction of Government, to order such payment, provided that the creditors shall first severally sign receipts in full for all their claims on the estate, and that if any fraud is subsequently discovered to have been committed by any creditor in respect to any money received by him under this rule, such creditor shall be liable to forfeit all sums so received, and all claim to further compensation for any debt due to him which may have been notified to the said Officer for satisfaction under this Act. And all sums advanced by Government under this rule shall be recovered from the estate, in the same manner as other debts due or liabilities incurred to the Crown or Government may be recovered under this Act.

- 13. The notification of any claim under Section VIII. of the said Act shall be understood to denote the statement of such claim before the Settlement Officer, accompanied by all such proofs and original documents required under the preceding rules, as it is the intention of the claimant to produce in support of the same. (Extra Rule sanctioned May 6th, 1863).
- 14. Advances made with the object of facilitating the settlement of the claims against any Talookdaree estate brought under the provisions of the said Act shall, when the Governor in Council shall so direct, be chargable with interest at 5 per cent. per annum. (Extra Rule, Government Resolution No. 2080, June 2nd, 1864).
- 15. When the condition of an estate shall be found sufficiently prosperous, it shall be competent to the Governor in Council to make such further award beyond what is permitted by the previous rules, as the circumstances shall seem to warrant. (Extra Rule, Government, Resolution No. 299, January 25th, 1865)

No. 2252 of 1862

REVENUE DEPARTMENT.

To E C. BAYLEY, Esq.;

Secretary to the Government of India.

SIR,—I am directed to acknowledge the receipt of Mr. Cristletter, No. 2137, dated the 23rd April last, relative to the Bill "for the amelioration of the condition of Talookdars in the Ahmedabad Collectorate, and for their relief from debt"

2. In reply, I am desired to state that it is impossible to supply

Mr. Pelle's report No 62 of 20th
July 1862, with accompaniment's
Reply from the Revenue Commissioner N. D., No. 2728, of 13th
December 1860
Mr. Pelle's further report No 10, of 22nd February 1861

Mr. Pelle's further report No 10, of 22nd February 1861

is requisite to make the objects and reasons for the Bill in question clearly understood.

### Statement of Objects and Reasons.

The necessity of the present Bill was forced upon the Govern-

dars, and of an important district, the actual cultivators of which are the tenants-at-will of the Talookdars. The Bill has taken its shape from the peculiar incidents of the Talookdar's history. These people are a Rajpoot yeomanry, all tracing their descent from one or other of five or six Hindoo Chiefs of some antiquity. The western districts of Ahmedabad are divided into numerous small properties, obtained by successive partitions, and now mostly consisting of but one or two fillages. The Rajpoots on each such property number from about 50 to 200, the steadily expanding issue of the first holder. They arrogate the position of gentry, consider manual labour degrading, and simply receive and live on a traditional share of the crops handed to them by their tenants-at-will.

When the Mahrattas held these districts they annually sent armes to collect a money tribute from these Rajpoots. The Rajpoot and the Mahratta Government theoretically halved between them the indlord's share of the crops, the Government half share being computed into a money payment at something under its full vulue. But is the Mahratta Officers always increased their levies wherever they could, whether from the superior Chiefs or from the petty yeomen, a fixed tribute was not the practice under their rule.

- 5. Following the policy of their predecessors, the first British Collectors, with ill-judged zeal, increased the demands of the State still further. The result has been that the properties have not improved, and these diriftless Rajpoot proprietors have fallen deeply into ag as a class careless and ignorant, although honest and en handed, they have during the last half century sunk deeper and deeper, and have become the victims of their own agents as well as their creditors, who both have equally made them their prey.
- 6. Circumstances still to be explained have, however, greatly complicated their position both as regards the Government and their creditors.
- 7. In the year 1821 the Honorable M. Elphinstone, regretting the heavy burden which, as above explained, had been laid upon the Rajpoots or Talookdars, sought, by fixing for periods of 5 or 7 years the amount of their tribute or Land Tax, to amend their condition, the object being to give them a prospective assurance that, during that period at least, the tax should not be increased upon them. It had long been the practice to take from the Talookdars yearly agreements to pay the tax placed upon them. The above assurance was henceforth embodied in these agreements, and gave them that

illusive resemblance to a lease which either misled subsequent Collectors, or tempted them to add clause after clause, the effect of which has been to annihilate the Talookdars' ancient proprietory rights, and convert them into mere lease-holders. The Talookdars had the alternative of either signing such leases as were laid before them or being ejected from possession, and, therefore, they did sign them, so that in the eye of the law by their own act their rights over, and interest in, their estates are now limited by their leases.

- 8. To the holders of such leases creditors have lent their money, but as many of the leases have expired and have not been monewed, and the rest have but a short time to run, and as the Talooka's as a general rule possess little or no property, the position of the creditors, it is not too much to say, is desperate.
- 9. The Government of Bombay, looking to the ancient status of these Talookdars, have long been anxious to restore them by reviving their ancient proprietory rights, and by remitting to them a portion of the taxtion which has been laid upon them, wherever it may be proved to be heavy, but it is manifest that the object of Government would be entirely defeated were the estates released from the leasehold tenure on which they are now held, so long as the Talookdars are in debt, unless the release were accompanied with a legal declaration that the estates so released could not be held liable for the liquidation of the whole of the existing encumbrances.
- 10. The effect of the measure, if not accompanied by some declaration, would simply be to sacrifice the rights which Government now legally possess over the estates, and precipitate the ruin and extinction of the Talookdars for the benefit of the creditoresisto whose hands the properties would at once and irretrievably pass, and to whom it would extend advantages which they hitherto have not possessed and have no right to expect, for the only available assets at present legally open to them consist of the temporary interest which the Talookdar possesses under his lease.
- 11. On the other hand, the preposed measure will secure to the creditors a much fuller and readicr satisfaction of their claims than they can possibly effect under the existing state of things by calling in the Civil Courts to their aid. They will under the operation of the Bill in the majority of cases receive their principal and interest at the laterate within a moderate period, while previously the realizations when the civil process.

- 12. In reply to paragraph 3 of Mr. Grey's letter, I am directed to state that the lands held by Talookdars are of two kinds only, viz., those held on Talookdaree tenure, and those which are known under the denomination of Wanta. These Wanta lands are insignificant appendages of the Talookdaree estates, and are appended to but a small proportion of the estates, and may be defined to be the residuum of a Talookdaree estate, for which immunity from taxation has been secured by giving up the other part of it to the governing nower. Such compromises were common where Talookdars came nto contact with the Moguls, and these Wanta lands have always been considered transferable property which the holder may charge or alienath. The Wanta lands are, therefore, such that the effect of Section 34 n the rights of third parties in them might be as contemplated in M. Grey's letter. But I am desired to observe that the Select Conmittee, after much discussion, and with a full knowledge of the ngure of Wanta, recommended the extension of the provisions of the fill to "Landed Estates of any description of tenure."
- 13. This course was adopted in order that an important end might be gained, viz., that there might be left no room for making reservations and exceptions in giving the Schedule of debts, and to prevent connivance between the Talookdars and any of his creditors to the injury and loss of others; in fine, to secure all the assets of the estate being held available to the liquidation of the claims of all the creditors in accordance with the priority of their title to consideration.
- 14. The Governor in Council is competent, under Section VI. of the Act, to make Rules for carrying the Act into effect, and His Excellency in Council, I am to state, will insert into these Rules a clause providing that the claims of mortgagees who are found to have been in bona fide possession of Wanta lands, prior to the passing of this Bill, shall be satisfied in full (next after any claims of Government) from the land on which they are secured.
- 15. The Bill, it will further be observed, contains a provision (Section VII.) for the sale of these Wanta lands in satisfaction of the claims of creditors, and it is anticipated that, with the aid of the Rules above adverted to, there will be no difficulty in inducing the Talook-dar to consent to the sale of the encumbered Wanta, or as much of it as will pay off the mortgage. In fact, the Talookdar's consent will be a mere act of honesty under the provisions of the Bill, and may be made a condition of his receiving the benefits of it.

- 16. With respect to mortgages on the land described in the Preamble to the Bill, I am directed to observe that it will be apparent to His'Lordship the Governor General in Council that such mortgages might easily take place while the leases above described are current, without justifying the belief that the land is "property which the Talookdar was able to alienate in satisfaction of his debts," and that this Government have no doubt of the legality of ousting on the termination of the leases the mortgages who may be in possession in virtue of mortgages of lands held under such leases.
- 17. In conclusion, I am desired to point out that as the powers for the relief of the Talookdars are entirely vested by the Bill in Government, and as it is not competent to any interested party to demand that a creditor shall be ousted out of possession of any vanta lands that may have been mortgaged to him, it was not considered dangerous to make the powers somewhat large, for it is fully as much the interest of Government to protect and relieve the important class of creditors as of the Talookdars themselves.

No. 3756 of 1862.

REVLACE DEPARTMENT.

To E. U. BALEY, Esq,

Secretary to the Government of India.

Sir,—I am directed to acknowledge the receipt of rour item. No. 4740, dated 1st ultimo, forwarding a copy of the Despatch from the Right Honorable the Viceroy and Governor General of India No. 14, of the same date, stating the grounds on which His Excellency has assented to the "Bill for the amelioration of the condition of Talookdars in the Ahmedabad Collectorate, and for their relief from debt," passed by the Legislative Council of this Government, and I am desired, with the view of removing the doubts which appear to exist in the mind of His Excellency the Governor General as to the necessity for the measure, to submit the following observations and remarks.

2. In the first place, I am to state that some misapprehension seems to have arisen as to the objects of the Act and the status of the

class of proprietors to whom it refers, by the erroneous application to them of the torm Talookdar in the sense which the word bears in the North-West Provinces. It was carefully explained that the word Talookdar, as used in that sense, was a misnomer as applied to the objects of this Act, but this has apparently been overlooked. The Taloohdars of Guzerat all call themselves Gametees, Grassias, and more frequently still Bhomeas, all which names indicate very ancient family possession. These proprietors are the direct issue of one Cadet of some Rajpoot Gadec. or Sovereign Chief, to whom two or three villages were given for support, a reversionary right to those village being retained by the chief or head of the class on the extinction of the Cadet's issue. The Gadees, or chiefships, (such as Bhowluggur, Limree, Khote, Gaumph, Gaugur) from which they have sprung, although somewhat curtailed in territorial possessions, still exist, and are recognized by the Gametees or Grassias as their natural had. The proprietary right of these Gametees, Grassias, or Bhomeas, s, therefore, as towards the public or State as complete as possible, but the name Talookdar as used in the North-West Provinces implies quite the reverse of a proprietary right. In that part of India it denotes merely a superior holder or chief, who, whilst settling his own State dues with the supreme authority, also settles for and represents a number of petty propiletors over whom he possesses a managing The use of the term Salookilar as applied to the Guzerat Grassias is, however, of such long standing that it could not well be now discarded

It has been above stated that a prescriptive reversionary interest in the estates of his kinsmen belongs to the head of each family. Mr Erskine, in the 4th paragraph of his note, expresses a doubt as to the stence of this right, and states that he does not feel sure that diligent enquiry might not make out a strong case on the other side, and show many open instances of transfers made in opposition to what he calls these alleged customary rules It seems to have occaped Mr. Erskine, in his perusal of the reports which accompanied the letters from this Government, that several open instances of transfers may be found narrated therein, but the occasional violation by broken down men of the custom of their people is no argument for the wilful annihilation of their common law, which is as distinct as it is ancient. The argument in the 5th paragraph of Mr. Erskine's note states a case which, if he refers to the absolute sale of the estate, is hardly parallel to the one under consideration; if, however, he refers to morigages only, no such argument was needed, for Mr. Peile, in paragraph 11 of his report No. 10, has shown that mortgages, not being contrary to the common law, were by no means unusual, and could be quoted by scores. The case stated in paragraph 5-of a whole clan being reduced to a sole representative, is so very improbable that it can hardly be quoted as a substantial argument.

- 4. With regard to Mr Erskine's remarks as to the political objects and reasons of the Bill, I am desired to observe that the conduct of the Grassias under circumstances of very great trial and suffering has been almost uniformly good. Their loyalty has not been impaired, nor have they been led to break the peace, toward their tormentors, but as the state of these men calls for immediate measures, and as the Government must help them or complete their ruin, it is certainly a question of some political gravity whether the State can safely, by declaring their estates (contrary to their common law) to be saleable and transferable, permit their creditors to strip them of all their property, and scatter a class of men of warface race and character, pennyless and reckless along the British frontier.
- 5. The mistake which declared them to be merely leaseholder has so far been a fortunate one that it has prevented the action of the Law Courts in opposition to the common law of these people, and has maintained them in possession of their estates, a circumstance which, no doubt, has greatly conducted to their loyalty and good behaviour above adverted to. But this Government feels that in correcting the mistake as to the tenure of these estates, which has grown up since 1821, the proprietary right of these Grassias should not be annihilated, whilst the claims of their creditors are critical to consideratio therefore, that it is necessary to have resort to such special legislation as the present
- 6. With respect to the argument in paragraph 8th of Mr. Erskine's note, it has been shown, in the reports which have been forwarded to the Government of India, that by the ordinary action of the Courts the creditors have been paid actually almost nothing, and that the present scheme has for its object to give them more than they would get in the ordinary course
  - 7. Mr. Erskine was probably unaware that in the case of Juska,

    \* No. 34, dated 14th April 1860 (copy of a report\* regarding which is now
    for the first time forwarded to the Government of India,) and in that of Bapoo Meeya the Kusbatee, the Civil
    Courts were unable to secure to the creditors one single Rupee, and
    that all the debts secured on these Talookas, the leasehold tenure of

which was terminated at the will and pleasure of Government, have been left unsatisfied, and that the law has really no remedy for the creditors.

- With respect to Mr. Erskine's 9th paragraph, it may be stated that the bulk of the old mortgages have taken place with Chiefs of the same race, such as those of Bhownuggur and Limree, and that all objectionable treatment of such mortgages will be obviated by the enth of the Rules which have been drawn up in accordance with Secion VI. of the Bill for the guidance of the Officer or Officers who may ee appointed to carry out the measure. Copy of the Rules which were drawn up immediately after the Bill had passed the Local Council are herewith forwarded, from which His Excellency the Governor General in Council will perceive that it is the desire of this Government to carry out the measures in a manner which will give the fullest consideration to the claims of every one. The lease system, it has been above stated, began in 1821, and, excepting the mortgages to he Chiefs above referred to, His Excellency the Governor in Council Delieves that there are very few cases in which the estates had not been openly converted into tenancies at will before the mortgages were made. In Juska, for instance, only 73 per cent. of the debts were of an earlier origin than the year 1838-39.
- 9. In paragraphs 11 to this note Mr. Erskine suggests what seems to him the least objectionable method of settling the claims of the creditors of these proprietary Grassias. This method is to prepare a piete schedule of the debts of all the estates, which are to be divided into those lightly and those irremediably involved. To the former a scheme like that of the present Act might be applied, whilst the latter would be sold in full satisfaction of all claims upon them.
- 10. The effect of this scheme, His Excellency in Council desires me to state, would be to admit the proprietary right of the Grassias, in order by ejecting such proprietors to satisfy debts which were secured only on a leasehold. This proceeding would be entirely opposed to the common law of the country, and an outrage on the ancestral customs of all Rajpootana. But, perhaps, Mr. Erskine's method of preparing the Schedules would render sales unnecessary, for if Hindoo heirs are by law to be freed from "liability to fathers' debts, not being specialty debts," there are many Grassias who would be free men in virtue of that very provision. But the common law of the Hindoos would be again violated by this provision, and it is, perhaps, not too much to assert that the Grassias would be reluctant

to claim a release which they could not deny to be dishonorable according to their own customs.

- 11. With respect to the observations made in the Despatch of His Excellency the Governor General, I am desired to explain that the character of leasehold has rather been recited in connection with these properties than fixed upon them in the Act, and in doing so the framers of the Bill had in view the opinions of successive legal advisers of this Government previously on record that the tenure was most nothing but leasehold. With regard to ousting mortgagees, has been explained that none would be actually ousted who did hold de leases not deliberately enter on possession of lands then which have since expired, or will expire next year. With respect to the restriction of the claims of creditors to twenty years' net produce, it is unnecessary to offer any remark, as the proposal that Government! should advance ready money, or buy up all the debts, will obviate any neccessity for enforcing this restriction, except when the creditors extraordinarily fraudulent or unreasonable. Such a mode of dealig with the question would have been before suggested, but owing to the financial difficulties of the State it has not hitherto been put forward.
- 12. With respect to the ruling of the Stamp law adverted to in paragraph 7 of His Excent pr's Despatch, I am to state that it was that of the Zilla Judge, and has since anten cancelled as erroneous; and in regard to the further remarks made in that paragraph relative to an amicable settlement of the creditors' claims against the Grassias, I am to add that the Grassias have no objection to such a court that the difficulty lies with the creditors, and this cannot better be exemplified than by the case of the Juska Talooka. Mr. Peile's report on the results of an attempt to arbitrate in which is as above appended. In that case the State had acted on the opinion of its Law Officers, the leasthold was at an end, and the village managed as a Government village. The full survey rental, except a bare subsistence remitted to the original Grassia proprietors, was collected by the State, and the dues of the creditors were altogether lost. Yet these men utterly rejected an award of double their principal. It cannot be supposed that creditors in better circumstances would be more moderate, and even if some creditors were willing to accept arbitration, others might hold back, and the whole scheme might thus be disconcerted by a few dissentients.
- 13. On these grounds His Excellency in Council prefers the provisions of the Act which has been passed to any action which might

be attempted by a combined application of Regulation VII. and Regulation XXV. of 1827, and Act VIII. 1859.

- If the Government are empowered to buy up the debts at a moderate price, few estates will be subjected to the 'more extreme provisions of the Act, and His Excellency in Council considers that the importance of finality and dispatch, which could not be attained by any alternative measures, cannot be over-estimated, not only as legards the parties more immediately concerned, but on the public round of improvement to one of the most important agricultural histricts in Guzerat.
- 15 With those observations and explanations before him, the Governor in Council trusts that the proposed measure may not appear to His Excellency the Governor General so extreme as it at present dogs; and feeling assured that it is calculated to confer a great benefi upon an important class of landholders without injury or the Infliction of any loss upon their creditors which the action of existing ws would protect them from, His Excellency in Council proposes, I am to state, at once to give effect to the Bill.
- 16. In conclusion, I am instructed to request that you will move His Excellency in Council to sanction the addition to the Budget of the year of a supplementary grant cover the expenses of the settle-It is difficult, I am trate, at present to foresce what sum may be required during the present Budget year, but His Excellency in tooable, under the provisions of the Act, that any advances will be made for payment of debts before the 1st of April next. It will be more easy, after some experience has been acquired, to calculate the the ensuing year.

I have the honor to be, &c., A. D. ROBERTSON. Acting Chief Secretary to Government.

Bombay Castle, 11th October 1862.

#### No. 3975.

#### REVENUE DEPARTMENT.

### Bombay Castle, 21st September 1863.

Letter from the Revenue Commissioner N. D. No. 823 A, dated 13th May 1865—Submitting, with his own observations and opinion, a communication from Mr. Peile, who suggests the propriety of seizing the opportunity of the Survey Settlement of all Talookdaree Estates not brought under the operating of Act VI. of 1862 to declare the nature of the Talookdar's title to their Estates to be proprietory.

RESOLUTION.—Mr. Peile has correctly assumed that it is the desire of Government to restore to the Grassia Talookdars the proprietally rights which have latterly merged in the leasehold tenure, and it has already been plainly declared that the recognition of these rights was deferred only until the Talookdars as a body were so far freed from encumbrances that the recognition would be a boon, and not an injury to them.

- 2. It was with this view to ation 20 of Bombay Act VI. of 1862 provided for the full recognition of right on the expiration of the term required to liquidate the debts of an Estate and the only question now is as to the most fitting time for a similar recognition in respect to Estates which do not come under the operation of the Act.
- 3. His Excellency the Governor in Council considers that the Survey Settlement is beyond question the most appropriate time for the change. Mr. Peile in giving the agreements under the new settlement to the Talookdars will explain to them clearly the liabilities they incur with the privilege of proprietorship.
- 4. A formal enquiry, such as is suggested in Mr. Peile's 7th paragraph, is hardly necessary. Mr. Peile is authorized to consider this recognition as applicable to all Talookas, with the reservation that it is not to be applied to those Talookas in which Mr. Peile may have reason to believe that there is still unsatisfied a debt for the liquidation of which due provision has not been made. Mr. Peile will ascertain and report on these cases, if there be any such, before delivering the agreements, as His Excellency in Council desires the

delivery of agreements to be of itself sufficient proof of the recognition of proprietorship.

- 5. The third clause of the agreement may seem somewhat inconsistent with a complete proprietary right, but its provisions appear to be required for the good management of the Talookas and the security of the Talookdars themselves, and it should, therefore, be retained. The only alteration required to the lease is at the close. In substitution for the words "at the end of that period according to the good condition of your cultivators will be the favour of Government to tards you" should be written the following—"At the end of that period the Talookas will remain in your possession as heretofore, subject to such revision of the Jumma as Government may deem proper."
- In conceding this right Government would wish to guard, as far as possible, against the concession being turned to the disadvantege of the Talookdar. It is, therefore, laid down that a Talooka, or cortion of a Talooka, is not to be sold for arrears of Jumma, except, a last resource, to collect the Government dues, and that when the present work of the Settlement Officer under Act VI. has been completed, no such sales shall be finally carried out, except with the previous sanction of the Revenue Commissioner.
- 7. There is also the danger transulent sales through the Civil Courts, and to guard again such frauds by the greatest possible publicity the Goranor in Council is pleased to direct that all sales of Talookde Estates, or portions thereof, in the Ahmedabad district be conducted by the Collector on the requisition of the Court under Section 248 of the Civil Procedure Code, and the Collector will then consider whether the provisions of Section 211 of the same Code and the Court with the consider whether the sale and satisfy the decrees by other means.
- 8. These precautions ought, in the opinion of Government, to give the Talookdars all the security they can reasonably claim.

H. E. JACOMB, Under Secretary to Government

# Statement of the Talookdars of the Ahmedabad Zilla showing Records, and the Area and Jumma of their estates as

N. B.—The Limree (Jhala) Estate is only a late acquisition by and was originally the property of Chorasumas or Kathees who are still found in the villages as "Mool Gametees."

Villages marked in Column'5 as '1 Co.' are undivided villages of which the produce is shared by several members of one family.

N. B.—The Kushatee Purmar Sher Khan has had eleven villages of his late uncle Bapoo Meia's Estate leased to him as a favour, on the term that he collects and pays over (minus expenses) the revenues of the lands already cultivated, and is to pay rent for the easily cultivable waste by degrees, while the less cultivable waste is at his disposal for the term of this lease viz., from A. D. 1863-64 to A. D. 1885-86.

Luteefkhan's Estate has been leased to him from 1864-65 to 1885-86 on the terms that he pays 70 per cent, of the survey assessment and is allowed to collect not more than twice the survey assessment.

## ABSTRACT OF VEERLE GASE

	Acres.	Goon.	•	Villages,
1. Cultivated	30,599 20,838	34 35 7	1. Jhalas	. 2 . 24 . 45

<sup>\*</sup>These Kusbatees say that they came from Khorasan and got their villages in gift from the Waghela Kings of Puttun. They paid a Jumma calculated on produce to the Moguls. They were dispossessed by the Gaekwar in his second farm of Ahmedabad (A. D. 1804-1814) but reinstated by the Peshwa. In 1823, eight out of seventeen villages were resumed, and the rest are held only during the pleasure of Government,

vicissitudes of seasons) on which the lands happened to be let out in the year preceding the Survey. In short, the rates have become so numerous and diversified, and the modifications applied to them so frequent, that I am satisfied the people have a very imperfect knowledge of the nature or amount of the rents they are called upon to pay."

- this confused state of the revenue management. Great part the remissions allowed for failure of crops was systematically ipropriated to then own use, whilst by their agency a system of nauthorised collections was generally introduced throughout the strict. This latter practice is said to have been carried to such a catent that in many cases the mauthorized exceeded the authorized collections of the village.
- 20. The Revenue Commissioner quotes a case in which the unauthorized collections amounted to Rs 357 against the Government demand of Rs. 137, and another of Rs. 789 against Rs. 255. Speaking generally of the state of things in respect to remissions and unauthorized collections, that officer says, "I firmly believe not one-half (the remission) has reached the ryots, and probably be portion of the actual collections that has been paid into the reasury has not been much greater."
- 21. About this time also a grievous system of torture for the realization of revenue had been secretly introduced. Rumours of its existence had reached the revenue officers of the collectorate, and, consequent on the receipt of petitions charging the native flicials of the district with inflicting personal violence upon certain individuals in extenting revenue, Mr. Elphinston, the First Assistant, was deputed by the Collector to make a formal inquiry into the matter.
- 22. Owing, however, to the suppression of evidence by the instrict officials, and perhaps to some extent to want of tact on the part of Mr. Elphinston, the inquiry resulted in two Mousalee peons employed in the collection of revenue being criminally considered of certain acts of torture and sentenced to a fine of 25 spees each, or, in default, to suffer a month's imprisonment.

The Mamlutdar was declared to be honourably acquitted on a charge of extortion, whilst four individuals were committed for trial at the sessions for giving false evidence against him.

- 23. Shortly after this Mr. Goldsmid was appointed to the charge of Indapoor for revenue as well as for other duties. On complaints of this system of torture being brought to his notice, a searching inquiry was instituted, and after a lengthened investigation, conducted with Fouché-like skill and ability, he succeeded in bringing to light a system of disgraceful and cruel torture which was being practised upon the people of the district chiefly at the instigation of the Mamlutdar.
- 24. The record of these proceedings shows that twenty individuals, including the Mamlutdar and several district and village officials, were convicted of charges of torture, or of aiding and aborting the same, and sentenced to imprisonment for periods varying from one to seven years. The Mamlutdar's sentence was for nine years in the first instance, but it was afterwards commuted to seven.
- Some of the acts of torture practised are reported to be too disgusting to record. But the following, extracted from the Judge's proceedings in the trial of the cases, are instances of brutal cruelty, such as it would scarcely be believed had been inflicted on human beings. In one instance a prisoner is charged with "forcing a man to stoop and hold his toes with pebbles under his feet, placing at the same time two stones, one on his neck and one on his loins, and compelling him to remain in the above position from morning until about midday." In another case the charge was "for compelling a man to stoop and hold his toes," and "having brought four pegs and a cord, commencing operations by tightening the same to fasten Crishnajee wullud Manajee (spread eagle fashion) to the pegs." And in another "for pulling down Mankajec by the of his hair from the raised ridge of carth near the Chowree of Bouree; beating him on the face, tearing his turban, and placing a stone on his head, and making him bear a stone on his head from daylight until 9 o'clock."

- 26. The following extract of the Judge's finding gives a full account of the circumstances of the case:—
- "The eight cases of revenue abuses having been this day completed, the Assistant Judge proceeds to record the view he has taken of them severally. As, however, they were all caused by the same cause, they may be considered merely different parts of the same subject. A few general remarks therefore, embracing the whole case, will prevent the necessity of the same remarks upon each individual charge.
- "Upon June 14th, 1834, Mr. Baber, who was then Collector of Poona, wrote to the Acting Mamlutdar of Indapoor, viz. prisoner Trimbuck Gungadhur, and told him that there were outstanding balances in the district of Indapoor amounting to Rs. 23,870-15-1 which, upon the receipt of the order, he was immediately to recover; that he was now only acting Mamlutdar, but if he did so he should be confirmed in the situation; and that if he made any report that the people under him did not give him every assistance they should be dismissed.
- "The Mamlutdar very properly wrote back to say that the ryots had had a hard year of it before, and Mr. John Burnett had accordingly allowed these balances to stand over, that the month of June was the worst month to come upon the ryots for payments. In fact the reply was in every respect most proper; it is dated (the Assistant Judge thinks) June 18th, 1834.
- "This very proper remonstrance was never answered, and the Mamlutdar, actuated either by hope or fear, commenced the system of abuses which forms the subject of these trials."
- 27. It is humiliating to find from these proceedings that the Judge considered the blame of these acts to be attributable in a great measure to the issue of an injudicious order by the Collector to the 'Mamlutdar, by which the latter's promotion was made dependent on his success in collecting the outstanding balances. This opinion seems to have been fully concurred in by Government, and thereupon instructions were issued to all Collectors,

enjoining them to take precautions to prevent the occurrence of such acts of cruelty.

- 28. But not content with the punishment of the perpetrators of these cruelties, Mr. Goldsmid made immediate inquiry as to the amount of revenue which had been extorted from the ryots by these proceedings. This resulted in his showing the sum of Rs. 8,863 to have been improperly levied, and he was at once permitted to refund it to the cultivators. The whole proceedings in the case will appear in the present day to be more like the incidents in a story culled from the pages of the Arabian Nights, rather than a chapter of events taken from the history of the revenue administration of the district.
- 29. There are still some civilians in the country who took part in these proceedings. The present Commissioner in Sind, Mr. Maisfield, was employed in Indapoor at the time, and the records show that he rendered good service in reforming the revenue administration of the district. There is also another distinguished officer who, in his early service, was associated with Mr. Goldsmid in his reformatory career in Indapoor, and who, after filling the highest position in the Civil Service, now presides over the Government of this Presidency.
- 30. The corrupt and demoralised state of the officials generally, combined with the confusion introduced into the accounts by the changes made in Mr. Pringle's assessment, told scriously upon the revenue of the district. Cultivation decreased, and notwithstanding remissions, the outstanding balances were annually being augmented. These facts will be made apparent by an examination of the following statement, which exhibits the Jummabundy, remissions, collections, and outstanding balances for the ten years preceding the advent of the settlement:—

Year.	Jummabundy.	Remission	Revenue col- lected.	Balance out- standing.
1826-27 1827-28 1828-29 1829-30 1830-31 1831-32 1832-33 1833-34 1834-35 1835-36	79,197 68,324 74,688 1,05,705 64,130 73,200 75,502 83,079 70,932 74,550	12,810 41,917 232  48,550 52,124 57,969  6,207 12,162	63,242 22,015 60,843 21,297 12,887 20,803 17,162 61,080 61,082 62,187	3,175 4,372 13,613 84,408 2,693 273 371 21,989 * 3,643 201
Total	7,69,307	2,32,001	4,02,568	1,34,738*
Ten vears'	76,930	23,200	40,256	• • • • • • • • • • • • • • • • • • • •

- 31. On analysing this return we find that during the period referred to the revenue of the district had in one year fallen to the small sum of Rs. 12,887, and in another (1832-33) it amounted to only a little above Rs. 17,000. For the ten years the average collections are Rs. 40,256, and the average annual remission amounts to Rs. 23,200, whilst the outstanding balance at the close of the period was Rs. 1,34,738.
- 32. It was at this crisis, with the district half depopulated by the effects of mismanagement and the unscrupulous rapacity of native officials—with a falling revenue and annually decreasing cultivation—with heavy outstanding balances betokening the poverty of the people and the low state of its agricultural resources—that the late Mr. Goldsmid proceeded to inaugurate that system of survey settlement which has since formed the groundwork of the revenue administration of the entire Presidency.
  - 33. It is interesting at the present time to notice the different schemes proposed. The first which assumed a definite shape.

<sup>\*</sup> Of this outstanding balance only Rs. 34,867 was collected, the remaining sum of Rs. 99,871 being entirely remitted in 1838.

was to take the old "Chahoor" as the standard for fixing the rates of assessment. This proposal emanated from Lieutenant Shortrede, who was employed at the time upon the duty of specially reporting upon Mr. Pringle's survey of the collectorate. kind of settlement," he explains, "which I would propose for the first year would be to let the best land at 60 rupees per Chahoor and the inferior at 50 or 40." This proposal was approved by the Revenue Commissioner, who, in submitting it to Government, observed as follows:-" By assessing the Chahoor the advantage of a ryotwar settlement would be secured to the people freed from the confusion in the accounts and facilities for abuse which appertain to the present system." The measure proposed may appear in the present day to have been somewhat crude, but if the state of the district at that period be considered, it would seem to be an improvement on the existing system of management, and in that light therefore the Revenue Commissioner's support of such a measure is accounted for. It afterwards received the sanction of Government, and orders were issued to carry out the plan as an experimental settlement for one year.

- 34. It is fortunate for Indapoor, and perhaps for the Presidency generally, that Mr. Goldsmid was entrusted with the duty of carrying out this measure. He foresaw at once the defects of such a plan of settlement, and lost no time in reporting against its adoption. The promptness indeed with which he addressed himself to the cancelment of the orders, and the substitution of a different system, is characteristic of that energy of purpose which he displayed throughout his official career. "Last night," he says "I had the honour of receiving your letter, " " directing me to take immediate steps for assessing the lands of Indapoor in the manner recommended by the Revenue Commissioner and sanctioned by Government;" and he then proceeds to explain his wiews upon the subject.
- 35. The chief defect of the proposed system, as explained by Mr. Goldsmid, is attributable to the circumstance of the Chahoor" not being a definite measure of quantity. He also tyresses some doubts "whether it was originally one of quality,"

or admitting that it were so, the integrity of the original divisions, he contends, was vitiated by the frauds practised in subdividing them into beegas. He then furnishes some practical illustrations of how unequal the assessment would be were it put upon the Chahoor.

- 36. Mr. Goldsmid next proceeds to explain that as the survey measurements of Indapoor Talooka have been found to be correct, they should form the basis of the new assessment. Being strongly impressed, however, with the desirability of retaining old names and denominations familiar to the cultivating classes (which indeed was one of the chief reasons given by the Revenue Commissioner for the adoption of the Chahoor) he considered it would be objectionable to adopt the acres, goontas, and annas of Mr. Pringle's measurement, and proposed therefore to convert them into beegas of the area of the Concan beega. This plan was approved of by Lieutenant Shortrede, and at his suggestion it was arranged that the new beega should be called the Pucka or Poona Beega.
- 37. The Collector and Revenue Commissioner approved of the abandonment of the Chahoor and the adoption of the acre as the basis of the new settlement. They disapproved, however, of the transmutation of the acre into beega as being no advantage, whilst it might have the effect of leading the cultivators to suppose that a new standard was about to be adopted. Government, concurring with the opinions of the two revenue officers, directed Mr. Pringle's measurements to be adopted, and they were accordingly utilised as the basis of the Indapoor settlement.
- 38. With regard to the assessment, Mr. Goldsmid proposed \*that in the first place every field should be gone over and its soil and situation carefully examined. With this and other statistical information before him he then proceeds to say, "I would arrange the Jerayet or unirrigated land in three classes—Ootum, Mudhum, and Kunist—and should thus be only following the course pursued with so much advantage by native governments in

other zillas. The land might, with reference to its class, be assess-

Scale 1st. Ootum at 2 acres per rupee. Mudhum at 3 do. do. Kunist at 4 do. do. Scale 2nd. Ootum at 3 acres per rupce. Mudhum at 4 do. do. Kunist at 5 do. do.

ed according to either of the two scales noted in the margin. I should myself prefer the lower, as, with the higher, remissions, I am convinced, would be often necessary in this talooka, where rain is so scarce." He proposed to try his plan experimentally in ten villages, and report the result to Government for

confirmation, before informing the ryots of the rates. He also strongly urged that the settlement should be confirmed for ten years in place of one, as in the proposals regarding the adoption of the Chahoor.

- 39. These modifications of the original proposals submitted by Mr. Goldsmid were generally approved of by the Collector and Revenue Commissioner, both officers advocating the adoption of the lower of the two scales of rates proposed. The Collector also recorded his opinion, that the maximum rate should be fixed by Government, the apportionment of the remaining classes of rates being left to the settlement officer. This discussion regarding the rates of assessment is fully reviewed in the following extract of the Government letter on the subject:—
  - "On this head the Governor in Council accedes to the general opinion, that their determination must rest with the settling officer, and has no difficulty in confiding it to Mr. Goldsmid. The general principles by which he should be governed in fixing the amount to be levied, may very satisfactorily be collected from the correspondence under consideration \* \* The suggestion of Mr. Mills, that a maximum should be fixed by Government on the first soil of land, is the only one of that gentleman's valuable observations on this branch. The Governor in Council is inclined to dissent; there is no reason why Government should in any instance fetter the discretion of Mr. Goldsmid, whose means of judgment far exceed those of any other person, and who is perfectly able to avail himself of these means."

- 40. The imposition of an extra rate upon well garden lands formed part of Mr. Goldsmid's scheme. A lengthened correspondence occurred regarding the policy of this measure, the Revenue Commissioner supporting Mr. Goldsmid's view, and the Collector opposing it. Government, in passing their decision upon the question, observed thus;—"The arguments on which he (Mr. Goldsmid) grounds this proposal are, as you justly observe, very sensible, and they are further enforced by your authority, but it seems to have escaped your notice that Mr. Mills distinctly disapproves of the increase, and his reasoning in opposition to it is, in the Governor in Council's opinion, conclusive."
- 41. On receipt of these instructions Mr. Goldsmid was directed by the Revenue Commissioner to submit a further report upon the question of imposing an additional rate on garden land, and the inquiry resulted in his being permitted by Government to carry out his original plan. The taxation of well lands was not, however, first introduced by Mr. Goldsmid. It formed part of the old Maratha system of assessment and of Mr. Pringle's also. I shall have occasion hereafter to remark at length upon this subject, but it seems expedient to record in this place that the plan of assessing well garden lands had not its origin with the Deccan Survey Settlement.
- 42. There was an entire accord amongst the several officers concerned as to the advisability of adopting a decennial instead of an annual settlement, and Government in sanctioning the measure expressed their approval of it in the following terms:—
  - "On reconsidering this subject it occurs to the Governor in Council that the notion of an experimental settlement for a year involves a fallacy. The object of the experiment must be to ascertain, first, what is the average produce of the lands in cultivation; and next, how far the ryots may by liberal terms be induced to cultivate more extensively. But these objects no twelve-months' experiment could possibly accomplish. With respect to the first, it is manifest that no single

year can be relied on as a test of the average annual product of lands. With respect to the other, it is equally plain that no terms, however liberal, can lead to extended cultivation under a lease of a single year. In short, the benefits to be expected from a decennial settlement depend precisely on the length of the term, and therefore no shorter term can afford any sample or specimens of them. The decennial term will itself be the best and the only experiment.

- "To agree with the ryot for a low rent and then to grant him only a year's holding, is, as Mr. Goldsmid justly observes, to sacrifice revenue without attaining the object of encouraging cultivation."
- 43. It will probably be thought that I have been somewhat prolix in my explanations and quotations bearing upon the question of the form of settlement proposed for adoption in Indapoor. But in regard to this I would observe that it has appeared to me that it would be impossible fully to appreciate the difficulties which the survey officers had to contend with in arriving at a judgment upon the point, unless all the circumstances that transpired are fully recapitulated. It has seemed equally desirable too that the views of the Government of the day upon the several proposals should be fully stated.
- 44. It will be seen from the foregoing remarks that the instructions committed to Mr. Goldsmid to carry out comprised the following points:—
  - 1st.—That the measurements of Mr. Pringle's survey were to form the basis of the assessment.
  - 2nd.—That a minute classification of all the lands of each village was to be made.
  - 3rd.—That he was empowered to fix the assessment rates of the district.
    - 4th.—That the settlement was to be considered decennial.
- 45. Great latitude was allowed Mr. Goldsmid in carrying out these instructions, and the sequel will show that, in the

exercise of the discretionary power confided to him, considerable modifications were subsequently made in the plan originally proposed.

#### PART II.—The introduction of the Settlement, and its results.

- 46. As Mr. Goldsmid was about to enter upon the duties of carrying out the foregoing instructions, he was joined by Lieutenant Wingate, who had been appointed specially to aid in the proposed settlement. Lieutenant Wingate soon displayed that ability and those peculiar qualifications for revenue and survey duties which marked his subsequent career. His first report on Indapoor contains several suggestions for revenue reforms, many of which have subsequently been engrafted into our revenue administration system. His clear intellect and sound judgment, associated with Mr. Goldsmid's strong reformatory talents and energetic character, formed a combined measure of qualifications peculiarly well fitted for the important work entrusted to them.
- 47. They soon set themselves to work. What portion of the survey and assessment work was more particularly undertaken by each does not appear from the records of their proceedings; but it is evident that both worked well and cordially together, and the success of their operations may doubtless in a great measure be attributed to this.
- 48. I think it better to allow Messrs. Goldsmid and Wingate to give an account of their own proceedings, and have therefore extracted the following paragraphs from Lieutenant Wingate's report on the Indapoor settlement bearing upon this subject:
  - "The accuracy of the measurement was tested by having a certain number of the fields of every village (marked off from the papers, by the European officers) re-measured by the carkoons of the establishment, whose work was subsequently tested by the surveying officer, and accuracy ensured by the prompt infliction of punishment upon occasion of error or negligence on their parts being brought to light. On the result of this investigation, should the survey measurements

have been executed with a tolerable degree of accuracy,\* they.

\*Within 10 per cent. of the truth. but when it appeared that the errors were beyond reasonable limits, and likely to vitiate the assessment, the village was wholly re-measured. The necessity of making an entirely new classification of the soil, without reference to that executed at the time of the survey, was owing to the latter being made after no general standard; the particular classes of soil in one village (as described in the 77th paragraph of Lieutenant Shortrede's report) not corresponding with those bearing the same denomination in another, which must have increased greatly the difficulty of forming an effective check, if it did not render this altogether impracticable.

"In consequence of this defect in the survey classification, Mr. Goldsmid determined to reject it altogether and re-classify the whole pergunna upon one general system, having reference solely to the natural productive qualities of the soil, and leaving wholly out of consideration extrinsic circumstances, such as vicinity to the village, command of water, &c., which, although carefully noted with the view of finally assisting in fixing the assessment, were not permitted to affect the classification. By this means the elements of the classification were reduced to a consideration of the natural fertility of the soil alone, which rendered the work comparatively simple, and enabled the European officer, after acquiring some practical knowledge of the different descriptions of soil usually met with, to become an effective check upon the carkoons engaged in classifying the land."

49. The villages of the Kullus Division were first brought under settlement in 1836 and the remaining part of the district the following year. There is still therefore another year of the 30 years' lease to run out in the latter case. It seems to be advisable to have the whole talooka brought under the revised rates at same time. On this account, as well as for the other reasons which have been given in an official communication, I have deemed

it expedient to defer the re-settlement of the Kullus Division till next year, when the whole district will be brought under the revised rates at the same time.

- 50. The talooka comprised 76 \* Government villages in 1836.
- \* Half of one village was, however, held in Inam at that time as belonging to the Deshmookhee of the Sattara Raja, have subsequently come under Government management, consequent on an exchange of lands made with the Raja, and were assessed in 1845. The half Inam village, which also formed part of the same Inam holding, has likewise been ceded, and was assessed also at the same time. In the early period therefore of the settlement lease and up to 1845 our revenue accounts will be for 74½ villages only.
  - 51. But although the settlement was partially introduced in 1836, no report upon it was submitted to Government till 1838, or after a lapse of two years. During this interval the other part of the district had been also brought under the operation of the measure, and the result for the whole talooka was embodied in one report.
  - 52. The original report was prepared by Lieutenant Nash, who was appointed to the Survey in 1836, and had taken part in the operations carried out in the principal, or Mamlutdar's, division of the talooka. His report is reviewed by Lieutenant Wingate and forwarded to the Collector, who submits the correspondence to the Reveue Commissioner with his opinion; and the latter transmits it to Government with his own remarks upon the whole question. Final orders upon the papers were eventually issued at the end of 1838, the letter being dated the 31st of December. All the correspondence referred to above is annexed, and will doubtless be read with interest, as showing the opinions of the day upon a measure which has since worked such great results.
  - 53. According to Mr. Goldsmid's original proposals, the classification of soil was to be carried out upon the rough plan of having three or four classes, as followed in the old native plan of

classifying land. It was found, however, on attempting to apply such a system, that it would be far too rough to effect an equable distribution of assessment. Upon this therefore Messes. Goldsmid and Wingate devised the plan of arranging the soils under three main divisions according to colour, each division being subdivided into three different grades or classes, thus making nine classes in all. A scale of values was assigned to the several classes thus formed, 12 annas being the highest and 2 the lowest rate.

- The Collector and Revenue Commissioner concurring in the reasons given by the Survey officers for this modification of the proposals originally made, expressed their approval of the system of classification adopted; but Government, in reviewing this part of the operations, observe as follows:—"The rates of these nine classes are said to have been derived from local inquiry and the experience of qualified persons, without any very minuteinvestigation into actual produce or actual expenditure. applicability of such rates must entirely depend on the degrees in which the framers of them were qualified for the difficult and delicate task of preparing them. There is no test to which they can be subjected except that of experiment for a fair series of years." But, though considering the information on this point defective, Government nevertheless, with a generous confidence in the officers employed, did not hesitate in according their sanction to this part of the plan of operations.
- 55. It appears from the remarks upon this subject that Government did not exactly understand how the classification of the soil had been applied to the assessment of the land. They seemed to think that extrinsic circumstances affecting the value of land, such as roads, markets, &c., should have been combined with the classification valuations, and imagined that Messrs. Wingate and Nash had overlooked these considerations.
- 56. It is not surprising that there should at first have been some misunderstanding of the principles on which the Survey offers had proceeded; but as regards the point under discussion, Lieutenant Wingate had been careful in explaining that these

extrinsic circumstances, though disregarded in the classification, "have been carefully noted with the view of finally assisting in fixing the assessment." The misconception of the Survey officers' proceedings seems, however, to be attributable to the circumstance of Government not understanding that the value of these extrinsic circumstances was considered and adjusted by a subsequent process, viz. in the fixing of the rates, which was then, and is still, an operation apart from the classification of the soil.

- 57. The Collector, Mr. Mills, considered both the maximum and minimum rates to be extremely low compared with the Mamool rates, but at the same time expressed his opinion that they were as high as they ought to be, considering the depressed condition of the ryots. He then proceeds to argue that the present state of Indapoor is fictitious to a certain extent, as the low assessment had attracted ryots from neighbouring states and from our highly assessed districts. He contends therefore that as the same low rates of assessment become extended throughout the collectorate generally, the fugitive ryots will return to their paternal fields; consequently that the increase of cultivation which had taken place during the two years since the settlement was introduced is temporary only.
- 58. These objections were answered in part by the Revenue Commissioner, Mr. Williamson: "As to the state of the district being fictitious," he observes, "this is true in part, if Mr. Mills meant that it is flourishing in comparison with other districts." A complete expose, however, of the incorrectness of the Collector's statements is to be found in a report from Lieutenant Wingate, written subsequently to the issue of the orders on the settlement.
- be due to the influx of ryots from other districts, Lieutenant Wingate observes, "Were the greater part of the newly taken up land in Indapoor actually found to be the consequence of emigration, this would form no valid objection to the new settlements, but it would materially weaken our anticipation of like immediate benefits resulting from the extension of similar settle.

ments to other districts, and on this account the determination of the facts of the case becomes a question of importance. The information contained in the returns before me fortunately admits of this being done in the most conclusive manner, and it will prove a source of satisfaction to Honourable the the Governor to know that the now apparently flourishing condition of Indapoor is due to no adventitious circumstances peculiar to that talooka, but simply to the reduction and equalization of assessment effected by the new settlement, and therefore that there is the fairest promise of like extensive benefits attending the introduction of similar settlements throughout the Deccan."

- Lieutenant Wingate then submits certain returns received from the Kumavisdar of the district, showing the number of new settlers or families who had emigrated to Indapoor since the commencement of the settlement. He afterwards sums up the result detailed in these statements in the following terms:-"It appears then that of the vast extension of cultivation that has taken place in Indapoor subsequent to the commencement of the operations for the revision of its assessment, 3,308 acres 16 goontas only are to be ascribed to new settlers and foreign sources of every description, whilst the whole of the balance, amounting to no less than 67,853 acres 18 goontas, has been effected by the exertions of its old inhabitants." The Collector's statement as to the causes to which the spread of cultivation was ascribable was thus shown to be incorrect, whilst subsequent events have abundantly proved the correctness of Licutenant Wingate's views, thus early expressed, upon the general effect of the settlement.
  - 61. In reviewing the remarks upon the assertment Government observe, "The question is not whether it is low enough, but whether it is not too low." The results of the measure, as shown in the increased revenue collections in 1836-37 and 1837-38; are admitted to be satisfactory, but Government seemed disposed to think with Mr. Mills, that the increase in cultivation was attributable to some extent to ryots being drawn to Indapoor from our neighbouring districts by the lowness of the new assessment. Subsequently however, on receipt of Lieutenant Wingate's letter

## THE INDAPOOR TALOÖKA

IN THE

POONA COLLECTORATE.

#### Bombay:

PRINTED FOR GOVERNMENT
AT THE EDUCATION SOCIETY'S PRESS, BYCULLA.

1868.

#### No. 298 of 1867.

REVENUE DEPARTMENT.

#### To F. S. CHAPMAN, Esq.,

Chief Secretary to Government, Bombay.

Sir,—With reference to my reports upon the revision of the assessment of Indapoor Talooka, which is now in course of transmission to Government through the Revenue Commissioner S. D., I would beg to represent that it would be satisfactory to myself, and I should suppose, as hereinafter explained, in accordance with the wishes of Government, were Sir George Wingate's opinion upon the measure obtained.

- 2. In making this suggestion I would beg to explain that when the question of revising the rates of Indapoor—the first settled District of our Presidency—was first raised, it was proposed by the late governor, Sir Bartle Frere, to entrust the duty to Sir George Wingate, and with that object the latter officer was solicited to pay a visit to Bombay for the purpose of making a tour through the country. Sir George Wingate intimated, in reply, that the failing state of his health rendered it inadvisable for him to return to this country, and consequently that he could not undertake the duty referred to.
- 3. Being made aware of these overtures, I explained to Sir Bartle Frere that in carrying out the duty of reporting upon the revision of the Interpoor settlement, which had been entrusted to me, I would endeavour so far to meet the wishes of Government in obtaining Sir George Wingate's opinion, that I would enter into correspondence with him during the course of my inquiries on the subject. Sir George, however, declined to give his opinion in this manner, stating as his reason for doing so that without the fullest details, which could only be obtained upon the spot, and without having had an opportunity of inspecting the country, he thought my judgment might be fettered by his opinion, formed,

perhaps on an imperfect knowledge of the changes which have taken place since he knew the district. At the same time he expressed a great desire to have an opportunity of discussing the subject personally with me.

4. Considering the great importance to be attached to Sir George Wingate's opinion, I would venture respectfully to suggest to Government that during my contemplated visit to England (for which I have already obtained leave) I may be permitted, with the sanction of the Secretary of State for India, to lay before Sir George Wingate all the papers connected with the report, and consult with him with the view to his opinion upon my proposals being recorded.

I have the honour to be, &c.

#### REVENUE DEPARTMENT.

### To the CHIEF SECRETARY TO GOVERNMENT.

Sir,—I have the honour to submit, for the consideration and orders of Government, a report by Lieutenant Colonel Francis, Survey and Settlement Commissioner, upon the revision of the settlement of the Indapoor Talooka of the Poona Collectorate.

- 2. The report was received in this office direct from Lieutenant Colonel Francis on the 18th March, and the Collector of Poona, with reference to it, wrote on the 2nd ultimo (letter No. 960) as follows:—
  - \*No. 147, dated report \* of Colonel Francis on the revision of 12th February 1867. the settlement of the Indapoor Talboka, without presuming to make any remarks of my own, my experience of the Talooka of Indapoor being so limited, while that of Colonel Francis has extended over many years."
- 3. \*The Survey and Settlement Commissioner in reporting (No. 1033, dated 4th December 1866) to Government that the lease of the Kullus Division of the Indapoor Talooka expired with the year 1865-66, and that under ordinary circumstances the revised rates would be introduced in the current year (1866-67), asked, for reasons which he fully explained (the chief reason being "to admit of the whole talooka being brought under the measure at the same time") to be allowed to defer for a year (by which time the lease for the remaining portion of the talooka would also have expired) the introduction of the revision.
- 4. The sanction of Government to defer the settlement was conveyed in Government Resolution No. 4574, dated 8th December 1866.
- 5. The present Survey assessment was introduced first into the Kullus Division of the talooka in 1836-37, and was extended in the following year to the remaining fortion of the talooka, when

the settlement for the whole talooka was reported to Government for sanction.

- 6. In the letter from the Chief Secretary to Government to the Revenue Commissioner—extract from which is embodied in paragraph 63 of Lieutenant Colonel Francis' report—it was decided that the duration of the settlement was to be for ten years, as originally sanctioned. It appears, however, from what Lieutenant Colonel Francis states in paragraph 64, that a reconsideration by Government of the arguments advanced by Lieutenant Wingate in favour of thirty years' settlement, the duration of the settlement lease for the talooka was fixed for thirty years.
- 7. The term of ten years, as originally fixed, was to date from the commencement of 1838-39, the two preceding years being considered years of probation; but for the Kullus Division it appears to have been considered to date from the commencement of 1836-37, and for the remaining portion of the talooka from 1837-38.
- 8. The Report now submitted contains a full and very interesting review of the following subjects:—

The state of the District and its Revenue Administration prior to the Survey settlement (Part I.)

The introduction of the settlement now about to be revised (Part II.)

Proposals for the reassessment of the Talooka, with full explanatory remarks with reference to the proposed rates, and the probable result of the revision as affecting the revenue (Part III.)

9. As regards the Survey operations under the late Mr. Goldsmid and Lieutenant (now Sir George) Wingate, which are noticed at length by Lieutenant Colonel Francis, notwithstanding the imperfect measurements, the omission to include in the measurements the "Gairan" and Hill lands and the defective classification, the general results of the settlement and measures of reform adopted in connection with it for developing the resources

of the talooka and in improving the condition of the cultivators, seem upon the whole to have been eminently successful.

- 10. A statement is given in paragraph 76 of the report which comprises a summary of the results of the settlement, and with reference to these Lieutenant Colonel Francis observes—
- "These results abundantly prove the success of the settlement. There is no district in India probably, not excluding even the provinces under the permanent settlement, which can show the annual collection of a revenue of above Rs. 80,000, subject for the period of ten years to a reduction of only 6 rupees per annum for remissions, outstanding balances, and contingencies of all kinds."
- setlements does not, or should not, involve either remeasurements or reclassification of lands, the object being to adjust the assessment, a measure rendered necessary by altered circumstances during thirty years, or whatever may be the term of the settlement, such as the rise and fall of prices, improved communications, &c.; but as regards the Indapoor Talooka it will be seen from what Lieutenant Colonel Francis states (paragraphs 108 to 118) that owing to "imperfect measurements," and to the survey being "faulty" and defective in other respects," an entirely new survey was found to be absolutely necessary, and there can be no doubt, I think, that Lieutenant Colonel Francis was fully justified in resurveying the whole talooka.
- 13. It will be also seen from what Lieut. Colonel Francis explains in paragraphs 120 to 124 that owing to discrepancies in valuation it was found "safe and expedient in many respects" to make an entirely new classification "based upon the improved system of operations, which with the experience of thirty years has been introduced into the Survey Department since Indapoor was first classified."
- 14. The system of survey that was adopted is the "traverse," a combined operation of the Trigonometrical and Revenue Survey systems. The results of the measure are noticed in paragraphs 117 and 118.

- 15. The main principles which Lieutenant Colonel Francis considers should guide revision operations are detailed in paragraphs 129 to 142, and in paragraphs 143 to 157 is shown how it is proposed to apply them to the Indapoor assessment.
- 16. The rates proposed in paragraphs 158 and 161 are as follows:—

A maximum rate of one rupee per acre, with a reduction of 2 annas for some villages, and a special increase of 2 annas for Indapoor itself. To 13 villages round about Kullus, extending from Kullus towards Baramattee, which are the most unfavourably circumstanced in respect to rainfall, a maximum rate of 14 annas is proposed.

- 17. For certain lands bordering on the banks of the Bheema, which are annually flooded by the freshes, and in this manner rendered more fertile, a maximum rate of Rs. 1-8-0 is proposed.
- 18. It will be seen that the increase of annas proposed is from 12 (the maximum rate on which the present assessment is based) to one rupee, which is equivalent by itself to an addition of 33 per cent.; but it is explained by Lieutenant Colonel Francis that, owing to new lands which have been held in excess of the assessed area having been increased and classified and the higher rate applied to them, the assessment will be increased to 53, instead of 33 per cent.
- 19. According to the statement embodied in paragraph 163, the amount of the proposed reassessment exceeds the present assessment by Rs. 43,309, an addition of 57 per cent. on the present assessment of the talooka. Still with this addition the average rate upon the whole culturable area will be only 7 annas 6 pies per acre.
- 20. This is moderate enough, it must be allowed, as an average rate, but I do not consider it the least too low for Indapoor. With reference to existing prices, and probability, if not certainty, of their continuing as high as they are now for years, improved communications, new markets, and such like considerations, if the Indapoor Talooka had an average rainfall which could be depended

upon, be it more or be it less, the proposed rates might be pronounced too low for a thirty years' settlement; but it must not be overlooked when considering the question of rates that Indapoor is one of the most unfavourably circumstanced of any of the talookas in the Deccan or Southern Maratha Country as regards its rainfall. In some parts of the talooka rain appears never to fall seasonably, and it is generally when seasonable scanty and precarious. Year after year lands are left unsown for want of moisture, and those that are sown produce next to nothing; failures of crops, more or less general and extensive, appear to be the rule, and a good, or even a fair, average harvest the exception.

- 21. Taking the above facts into consideration, and weighing them against the other considerations, the balance is, I submit, greatly in favour of very low rates of assessment. I might go further and say the lowest that can be fixed without unnecessarily sacrificing revenue—if it is intended that the revenue should be realized according to the assessment—as far as I am in a position to judge, I have no hesitation in offering it as my opinion that higher rates could not safely be proposed, and would therefore respectfully recommend that Lieutenant Colonel Francis' proposals be sanctioned.
- 22. The assessment of the well garden lands is noticed in paragraphs 174 to 178. Lieutenant Colonel Francis considers that the time has come for discontinuing the extra cess, if not in all districts, as a general rule in drought-stricken districts like Indapoor.
- 23. Lieutenant Colonel Francis' proposes in lieu of the extra cess a plan of assessment according to which the first class Jeerayet rate is to be applied to such lands irrespective of the rates assigned for Jeerayet classification, and in this proposal I fully concur, and would respectfully recommend that its adoption be sanctioned, not exclusively for Indapoor, but as a rule, when the time for revising the Survey assessment comes, in every district which has suffered, and continues to suffer, like Indapoor, from drought, or a succession of unfavourable seasons.

- 24. As observed by Lieutenant Colonel Francis in paragraph 176, it is almost impossible to overrate the importance of well cultivation in a drought-stricken district like Indapoor, and it is, I respectfully submit, the duty of Government to afford every possible encouragement to it.
- The remarks made by Lieutenant Colonel Francis in paragraphs 179 and 180 appear to me to be very just, and they will doubtless be fully considered by Government. objection to the adoption of the course recommended at the close of paragraph 180, viz. that "for a stipulated period," say pending the duration of the settlement, no addition shall be made to the local land revenue, one anna being the maximum amount leviable during the new lease.
- 26. As regards the duration of the proposed settlement, Lieutenart Colonel Francis has, I am respectfully of opinion, satisfactorily shown that a permanent settlement is wholly inapplicable to a district like Indapoor. I entirely concur in the views expressed by Lieutenant Colonel Francis in paragraphs 181 to 185, and would beg to support his recommendation that the proposed revised assessment be declared unalterable for the term of thirty years.

I have the honour to be, &c.

J. W. HADOW,

Revenue Commissioner S.D.

Camp Mahableshwur, 22nd May 1867.

No. of 1867.

To E. P. DOWN, Esq,

Collector of Poona.

January 1867.

SIR, -- The thirty years' lease of part of the Indapoor Talooka having expired with the past revenue year, I have the honour to submit a Report upon the Revision of the Settlement of the district.

2. Before entering upon the more immediate subject of my report, I shall endeavour to lay before you a brief history of the state of the district, and of its revenue administration generally, prior to the introduction of the Survey Settlement. The history of that measure will come next in order, and I shall then explain my own proposals for the reassessment of the district.

## PART I.—The state of the District and its Revenue Administration prior to the Survey Settlement.

- 3. The Tunka assessment fixed by Mullic Umber during the Mahomedan government of the Deccan is the first revenue measure of which any account has been retained. The Tunka, which is the jumma or total assessment of a village, was a cash rental, based according to traditionary accounts upon an estimate of a third share of its produce. The assessment was fixed in the gross, its apportionment to individual holdings or estates being left to the village community.
- 4. The Tunka continued for some time after the Maratha government was established, but was eventually superseded, in or about the year 1784-85, by what is generally known as the "Kumal" assessment. This assessment was grounded upon a classification and valuation of the land of each village. It would appear to have been undertaken partly with the view of ascertaining the general capabilities of the district, and thereby furnishing the State with a record of its own resources, though the increase of the public revenue was doubtless the main object of the measure.
- 5. From the different accounts of the state of the district at the period, it seems to be generally established that the resources of the country had been considerably augmented since Mullic Umber's assessment was imposed. The predatory habits of the Marathas, and the plunder gathered by the Paishwa's army from other parts of India, tended mainly, no doubt, to bring about a more prosperous state of things. The depreciation in the value of money since the Mahomedan standard of assessment was fixed is another cause which, no doubt, operated in producing a revision of the State's demands.

- 6. A revision under such circumstances was certainly justifiable, as the State might fairly claim some share of the general increase in wealth resulting from changes which its own policy had been mainly instrumental in bringing about. Unfortunately, however, the Maratha government over-estimated the value of the permanent resources of the district, and pitched their assessment much higher than it should have been. The Kumal assessment for the whole district, as it then existed, amounted to about Rs. 2,22,800, whilst the Jumma of the Tunka, which it had superseded, was only Rs. 1,22,000. The total assessment of the district was consequently more than doubled by this new measure.
- 7. The realization of this assessment being soon found impracticable by the officials, the plan of farming the revenues of the district was next resorted to. This led to the introduction of a system of levying extra cesses in excess of the standard assessment, that being almost the only means by which the farmer could obtain any profit. Many of the cesses thus imposed were subsequently included in the accounts under the head of "Babtees," and thus became an integral part of the State's demands.
- 8. The levy of these extra cesses, incursions of plundering armies, and a succession of bad seasons, had nearly depopulated the district, when, in about 1807-08, the Government endeavoured to re-establish villages by the introduction of a system of leases (Istawa) providing for a small annually-increasing rent, extended

Note.—Kumal rates should, I think, be substituted for Tunka, as the latter had been superseded; but I have used the Revenue Commissioner's words.

over nine years, when the Tunka rates were to be taken. This measure proved generally unsuccessful. A further term was then added to the leases; meanwhile the Maratha war broke out, and the Deccan was ceded to the British government.

9. During our early administration of this district the revenue was generally collected under a system of Ookta and Kowlee rates, the management and fixing of which was left almost entirely in the hands of the Patel and Coolkurnee. The Istawa lease system of the former government was also adopted in some cases.

No regular system was inaugurated, and the different settlements attempted proved unsuccessful.

- 10. A succession of bad seasons supervening upon these imperfect arrangements tended to complicate matters. Failure of crops and high rates rendered annual remissions necessary. Owing, however, to the corruption of the district and village establishment, by far the greater part of the sum intended as a relief to the ryots was appropriated to their own use by the native officials. This, added to the general disordered state of things, completed, as the Revenue Commissioner has expressed it, "the confusion of the village management."
- 11. It was thought that a regular survey and assessment would remedy these defects, and accordingly such a measure was inaugurated under Mr. Pringle. That officer's operations comprised a field survey of all the cultivated and culturable lands of the village, accompanied with a regular classification of the soil. He prepared elaborate estimates of the produce of the different kinds of soil, and after allowing for expenses of cultivation, a certain percentage of the remaining net produce was taken as the assessment of the land.
- But Mr. Pringle's settlement, though fixed upon a system which at first sight appears to be the best practical way of arriving at an estimate of the capabilities of the soil, and thence deducing its assessable value, has nevertheless been admitted to have been an entire failure. The failure was due in some measure certainly to the faulty and dishonest manner in which the classification of the soil was carried out and the crop returns prepared. independently of this, I am persuaded that it is almost impossible to frame returns of the produce of a district having such an uncertain climate as Indapoor. For three consecutive years in some parts a general failure of crops has been known. A bumper season follows perhaps, which again is followed by two or three years of more or less deficient returns. A fair average should of course embrace a series of these several years. I need hardly say the preparation of such returns for all kinds of soil-and Mr. Pringle's system proposed to fix the assessment on such data—is a

work of time and labour which no man could reasonably expect to be able to carry through.

13. The causes of the failure of his system have, however, been fully described by the Survey officers employed in the assessment of Indapoor—Lieutenant (now Sir George) Wingate and Lieutenant Nash—from whose reports the following extracts have been taken:—

"The Survey rates were fixed at fifty-five per cent. of the net profit on land, and of this sys-Lieut. Nash's Report. tem the disproportion above alluded to appears to have been the natural effect. Assessing fields at a percentage of the net profit was, in fact, remunerating the cultivator, not in proportion to the value of the field on which he laboured. To show how unequally by this system people requiring the same funds for their support were remunerated. I have calculated from the Survey paper of thirteen villages in the Indapoor Pergunna the sums which, had the Survey been conducted in other respects on right principles, would have been left with the respective holders of fields of the nine kinds of soils so differing in size as to require each an annual expense of 5 rupees for their proper cultivation. They are as follows : --

lst Black. 2nd Black.	3rd Black.	lst Red.   2nd Red-	3rd Red.	1st Burrud.	2nd Durrud.	3rd Durrud,
Rs. a. p Rs. a. p. 2 11 11 2 8 7	1 3	1				

"The fair sum to have left with each of the owners of these fields, as calculated from the same papers, would have been somewhat more than one rupee."

14. In commenting on these remarks Lieutenant Wingate observes —

"To afford a further illustration of the effect of these principles upon the Survey assessment, I have compiled the following table from the papers of the village of Ooplay Boodrook in the

Marha Talooka, in which the assessment was fixed at 55 per cent. of the net produce as estimated by Mr. Pringle's assessors. Column No. 1 of the table gives the number of acres of each description of soil, which, according to their calculations, can be cultivated at an annual expense of 100 rupees. Column No. 2, the net produce per acre, and No., 3, 55 per cent. of this, or the rate of assessment; No. 4, the amount of assessment upon the number of acres enterd in column No. 1, and No. 5 the balance of net produce or profit remaining to the cultivator. By inspecting the last-mentioned column it will be found that from 1st Black to 3rd Burrud the profits of cultivation vary from Rs. 32-8-3 to Rs. 12-5-3, the expenses in every case being 100 rupees. The total amount of assessment upon the number of acres entered in column No. 1 of the table is Rs. 236-7-2, and the three last columns are entered to show how, under the supposition of this remaining the same, the rates should, in my opinion, have been . adjusted to leave the profits of cultivation in all cases exactly equal.

"There are, however, other sources of error in the Survey." assessment to which, with that already mentioned, must be attributed its failure, more than to any defects of execution. chief of these consist in it being founded on an average of the prices of grain and the amount of collections during previous years. without a due consideration being given to the actual condition of the people, and to an investigation of the causes which during the years of the average had made these prices and collections stationary or fluctuating, advancing or declining. To adopt as a basis of assessment an average of past collections was to admit that the previous settlement was not heavy as a whole, but merely required being properly apportioned, which the yearly increasing poverty and wretchedness of the people, a declining cultivation, and a progressive fall in the price of grain, notwithstanding a diminished supply, all tended to disprove. The calculations, too, for fixing the Survey assessment were made upon the supposition. of the land being properly tilled, whereas there is perhaps not one field in ten in this collectorate that is so, or that commonly yields the quantity of produce estimated in the Survey returns. circumstances contributed to make the Survey assessment high, while fixing it at a percentage of the net produce made it unequal; and to them may be attributed its failure rather than to the venality of the native establishment employed in carrying it into These may have been bribed in numerous instances to effect a reduction of the rates, but this would have tended to secure the success, rather than involve the failure, of an assessment, and that they should systematically over-assess inferior and uncultivated lands without the prospect of gain, and at the risk of detection, appears to me very improbable. I have dwelt at this length upon the Survey assessment at the risk of being thought tedious on a question not immediately bearing upon my subject, that by exposing the sources of error which, in my opinion, occasioned its failure, my superiors may be better able to form a correct estimate of the principles on which the present revision has been conducted."

15. According to the opinions of the officers here quoted,

the failure of the settlement is attributable more to the faulty principle by which 55 per cent. of the net produce was set apart as the basis of the assessment than to the malpractices of Mr. Pringle's native establishment. Both causes combined, no doubt operated in bringing about the result, and for our present purposes it is immaterial which had the greater influence.

- 16. The defects of the settlement were early foreseen by the revenue officers. In the first year of its introduction the Collector expressed great fears of its success. He reported that the Jummabundy, according to the rates, amounted to Rs. 91,589, of which only Rs. 42,299, or less than one-half, could be realised. In the following year the ryots refused to cultivate their fields according to the Survey rates, and after local inquiry the Collector directed that no increases exceeding 25 per cent. on the former assessment should be demanded. Afterwards it seems to have been ordered that for the year the new rates should be collected only in cases where they were lower than the old. This arrangement failed, and remissions had to be granted.
- 17. It was next sought to remedy the defects of the settlement by the adoption of a scale which provided that only a regulated portion of the increases due to that measure should be collected. It was also arranged that half the new assessment should be remitted in respect of lands which had been waste five years anterior to its introduction; and further, in cases where lands had been longer out of cultivation, that only a fourth of the assessment should be levied.
- 18. In summing up the result of these measures the Revenue Commissioner observes as follows:—
  - "The prescribed assessment has thus fluctuated between the former rates and the new. It may be supposed that the former rates referred to some well-known standard of taxation. But this is not the case. They would be better described as the result of accident or temporary circumstances; for what was adopted as the basis was really the Ooktee and Cowlee rates (which are liable to fluctuate annually according to the state of the village, the means of ryots, and the

alluded to above, the results of the settlement were pronounced to be highly satisfactory.

- 62. In disposing of the question affecting the manner adopted for assessing well Bagayet lands, Government agree with the Revenue Commissioner that Mr. Mills had misunderstood the orders of the Honourable the Court of Directors, directing that "land should be assessed according to its capability, and not according to its produce," in quoting them as prohibitory of an assessment being placed upon Bagayet land. They then observed, "The capability of the land depends as much on the facility of irrigation and local peculiarities as it does on the colour and depth and other qualities of the soil. The principle therefore on which Bagayet is assessed at higher rates than Jerayet is one which must be admitted generally." They next proceed to consider whether it would not be expedient to suspend the operation of the principle in a district where water is deficient like Indapoor, and, finally, dispose of the whole question in the following terms:-"Your predecessor has stated his opinion that the rates fixed are low, and that the country is well able to bear them. The Engineer officers seem of the same opinion, and the Honourable the Governor in Council therefore considers it unnecessary to direct any change to be introduced."
- 63. The last, but perhaps the most important, point of the report upon which a decision had to be passed was in respect to the duration of the settlement lease, whether it should be for ten years, as originally sanctioned and strongly recommended by the Collector, or whether it should be for thirty years as proposed by Lieutenant Wiegate and advocated by the Revenue Commissioner. The decision was in favour of the ten years lease; and I think it right to quote in extenso the arguments advanced by Government in arriving at this decision:—
  - "The period during which the present survey and assessment is to be secured without enhancement to the ryots is next to be considered. Lieut. Wingate is disposed (para. 17) to a permanent settlement, or, at least, to one of thirty years' duration, instead of the term, at present fixed, of ten years.

This reasoning is of a general nature applicable to the general question, whether a permanent is not, cæteris paribus, preferable to a temporary settlement. Your predecessor, I am instructed to state, is a strong advocate for permanency, while Mr. Mills argues on the other side, and it must be admitted that his arguments are weighty and deserving of serious consideration.

"It must not be forgotten that the very causes which have been cited as the grounds for the present measure are still in full operation. The price of grain is still falling, and it is impossible to say whether the average of the next ten years may not be as much below that of the last, as that was of the ten years preceding. Where there is but one staple produce in the country, as is unfortunately the case in these districts, and that staple grain, there is far more probability of such a result than in a country producing articles of export or for manufacture within it, even though the value of the precious metals should remain stationary. On the other hand it is impossible to foretell what may be the result of the continuance of our rule and of those measures for the improvement of the country and of the condition of the people which we are gradually introducing.

"Added to this is the consideration that the present is but an isolated experiment. The extension to the whole of the Decean of the same measures and the same rates of assessment as those introduced into Indapoor may, the Governor in Council conceives, be productive of results which will materially affect the now apparently flourishing condition of that talooka. Enjoying now advantages which are confined to it alone, it is not to be expected that the elevation of all the surrounding districts towards its level will not be attended with some corresponding depression of Indapoor. The height to which it has been raised may prove rather relative than esitive, and, if so, an adherence to the present measure as a sermanent settlement may produce the very evils which it is so desirable to avoid. Numerous failures ought, moreover, to

lead us to hesitate before placing ourselves in a position from which we cannot retrace our steps. It is very true, as Mr. Williamson argues, that by fixing the present as maximum rates we can always step forward to relieve the agricultural classes by further reductions, but the present rates have not, it must be confessed, been fixed on so perfect and decisive a principle as would justify Government in limiting its demand on the land to them under every change of circumstance to which the country can by any possibility be liable.

- "The Governor in Council therefore conceives that it would be preferable to adhere to the term first fixed of ten years, say from the commencement of the present season 1838-39. Assuming that the two preceding years have been years of probation, the revision having taken place but partially in 1836-37, and having been extended throughout the pergunna in 1837-38, there can be no objection to declare the intention of Government, at the expiration of this period, to continue the settlement for a further term, should the beneficial effects expected from it be found to have resulted."
- 64. The question of the expediency of granting thirty years' leases was soon again brought before Government by Lieut. Wingate, and, in re-considering the arguments in its favour advanced by that officer, it was eventually decided, in 1838, that the settlement already introduced, as well as future ones, should, as a rule, be considered fixed for thirty years.
- 65. With the exception of the mention of a 12-anna rate in Lieutenant Wingate's report, there appears to be no other allusion in the official correspondence to the maximum rate fixed for the district. I find, however, from the Marathi records, that the same rate was applied throughout in the villages of the Kullus Division, as well as in those settled subsequently in 1837.
- 66. It is difficult to make out the amount of reduction resulting from the immediate application of the new rates. According to the statement given in the report, Mr. Pringle's assessment on the whole district amounted to Rs. 2,03,000, whilst the new survey

Jumma is stated in round numbers to be Rs. 84,000.\* The differ-

ence between these two assessments is \* Is also entered in the Rs. 1,19,000; but as these statements include report as Rs. 83,8185 the assessment of the waste as well as of the cultivated land of the district, they do not show correctly the actual reduction made at the introduction of the settlement. No comparative statement showing the immediate effect of the measure upon the cultivated area seems to have been prepared at the time. This omission is probably attributable to the confused state of the accounts caused by the many changes made in Mr. Pringle's rates, by which, as before explained, the realization of a considerable part of his assessment had been foregone. The fairest way. perhaps of showing the immediate effect of the measure is to compare the Jummabundy fixed for the year preceding the settlement with that of the settlement year, which gives the following result :- "

•	. Jummabundy.	Remission and Outstanding Balances.	Realization.
	1836-3799,030	30,240 4,193	
	-	the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the same of the sa	
	26,239	$\frac{26,047}{}$	192

- 67. According to this statement the reduction in the Jummabundy of the two years here compared amounted to 26 per cent. This, however, can be regarded only as an approximate estimate of the actual demand upon the land under the two settlements, as the temporary reductions made in Mr. Pringle's assessment are involved in the account.
- 68. The settlement was followed by an immediate extension of cultivation. The extract of Licutenant Wingate's letter, given in a preceding para, shows that the large extent of 67,853 acres of waste was brought under tillage during the first two years of its operation, and cultivation kept steadily increasing annually up to 1849.41, when the total area of the waste was comprised under the small extent of 5,160 acres. The revenue of this year amounted

to Rs. 76,192, whilst the remissions given (Rs. 905) bore the small; proportion of about 14 per cent. on the whole demand.

- 69. A slight check to cultivation set in from this period, and owing to the occurrence of two consecutive bad seasons (1844-45 and 1845-46) the waste during the latter year had again increased to 24,550 acres, whilst the remissions given were above 50,000; the revenue actually collected being only 22,770, or about one-third of the demand. This brings us to the end of the first decennial period of the lease.
- 70. From the results here detailed I think we may infer that the great fall in the revenue, accompanied with an extensive decline in cultivation which took place in the two last years, is attributable to the ryots having taken up more land than they had the means of cultivating properly. They were unable to meet the Government demand on the occurrence of the first bad season, and a second following immediately upon it called for remissions on an extensive scale. So far therefore as we can form an opinion from these results, the assessment to this date may be said to have been quite as high as the people could afford to pay regularly.

\* Ten years' average.
Under Settlement Rs. 65,220
Prior to do. ,, 40,256

Rs. 24,964

The average realizations of the ten years show an increase certainly of nearly Rs. 25,000\* over and above the average of the ten years preceding the introduction of the settlement, but then, again, the remission in the last year, as above mentioned, exceeded Rs. 50,000.

- 71. During the first five or six years of the next decennial series, commencing with 1846-47, cultivation was somewhat unsteady, the extent of the waste having ranged from 24 to 11,000 acres. It then took a fresh start, and in 1855-56, the last year of this decennial series, the total extent of unoccupied land was reduced to 1,300 acres.
- 72. The collections were much more regular during this period, and remissions, with the exception of two years, when

they amounted to Rs. 2,700 and Rs. 3,900 respectively, had ceased almost entirely. They were quite nominal during the last two years, being respectively only Rs. 11 and 18. The average annual realizations for the period amount to about Rs. 77,000.

- 73. The almost entire cessation of remissions during this period may be taken as a certain indication that the cultivators' resources had materially improved. They could now pay their assessment in indifferent seasons as well as in good ones, for the annual Jummabundy reports of the district show that there were several such seasons during the period referred to. The gross revenue payable for the ten years amounts to Rs. 7,79,194, which was all realized with the exception of the small sum of Rs. 8,655, thus showing that the collections were only a little more than 1 per cent. lecs than the full demand.
- 74. This brings down our review of the settlement to the last ten years of the lease, embracing the past year of 1865-66. The whole district may be said to have been regularly under cultivation during this period, the highest return of waste in any year being only 1,176 acres. The accounts of the past year show an extent of 930 acres under the head of waste; but this return includes some tracts of assessed gairan made over to the villagers as free grazing lands, but which, owing to their bearing an assessment, have been included under the waste. But with the area unduly increased by this mode of account, the waste bears the infinitesimal proportion of \( \frac{1}{3} \) per cent. to the total area of the district.
  - 75. The revenue returns for the period are perhaps even more satisfactory. Out of the large amount of Rs. 8,30,545, which is the aggregate revenue demand for the ten years, only the sum of 61 suppees had to be foregone.
  - 76. The following statement comprises a summary of the several results explained in the preceding paragraphs:—

	Avı	ERAGE ANN	UAL		
	Jummabun- dy Settle- ment.	Remissions.	Collections.		average of preceding
•	Rs.	.Rs.	Rs.	Rs.	Percentage.
First decennial period	77,443	12,223	65,220	24,964	62
* Second ditto	77,919	865	77,054	36,798	91 ·
* Third ditto	83,054	6	83,048	42,792	106
General average of the 30 years	79,472	4,365	75,107	34,851	86

These results abundantly prove the success of the settlement as a revenue measure. There is no district in India probably, not excluding even the provinces under the permanent settlement, which can show the annual collection of a revenue of above Rs. 80,000, subject for the period of ten years to a reduction of only 6 rupees per annum for remissions, outstanding balances, and contingencies of all kinds.

- 77. But the settlement would have been comparatively of but little benefit to the cultivators if it had not been accompanied with measures for developing the resources of the district. Foreseeing this, the Survey officers turned their attention at once to this subject. The opening of roads and devising improved means of transit were the primary matters of consideration. Amongst the useful improvements projected at this time, the construction of a new description of light cart proved a measure of the greatest importance.
- 78. In a speech delivered at one of the debates upon the Survey Bill, His Excellency Sir Bartle Frere has given an interesting description of the proceedings of the Survey officers at this

<sup>\*</sup> Note.—Five and six per cent. respectively should be deducted from the revenues of these periods as a set-off for the collections from two lapsed villages not included in the ten years' average preceding settlement.

riod. Speaking of the state of the Poona and Sholapoor districts, he observes—

"Beyond Poona, carts were then very rarely seen; in five months he remembered seeing only three carts in the districts between Poona and Sholapoor, and these were brought from some Madras station. The only indigenous cart-wheels were at that time mere discs of stone; the carts were large lumbering contrivances, and remained as heirlooms in families for genera-They were so heavy that it took eight or ten bullocks to draw them when loaded. They were not used for the carriage of ordinary produce, but only for carting manure to the fields. Now the first step towards improving the physical condition of an agricultural people in a low state of civilization is to give them increased facilities of communi-Lieutenants Wingate and Gaisford early apprehended this fact, and applied themselves to increase the facilities of transit in the Deccan. They had at first very small means at their disposal for the attainment of this object. Government at first gave Lieutenant Wingate small sums, often as low as Rs. 5 per mile, for the improvement of Little could of course be done for such an amount beyond removing the most serious impediments to wheeled traffic along existing tracks, but even this was a great boon to the country. Lieutenant Gaisford then applied himself to improve the country cart. The ordinary Deccan cart in its present form was the result of his labours, and it would be difficult to convey to any one who had not witnessed it, an adequate notion of the amount of time, trouble, thought, and contrivance which were applied to invent a cart which should meet all the conditions required. It was to be as light and cheap as possible and yet strong enough to be used in a stony country, where roads were almost unknown, and where artificers capable of repairing the most simple wheeled vehicle were often not to be found within fifty miles.

"Lieutenant Gaisford set up a manufactory for these carts at Timboornee in the Sholapoor districts, and there he

not only made carts but trained artificers from the village around to repair them. At first it was difficult to find any one who would buy the carts even at cost price, except as a favour; now they have entirely replaced not only the old carts with stone wheels, but the Brinjarce bullocks, which formerly did the whole carrying work of the country. And the carts have in their turn helped the improvement of old roads and the opening of new lines of communication. If the survey had conferred no other benefits on the country than by contributing, as they had done, towards the formation of good roads and a good description of wheeled carriage, it would have more than repaid all the expense that had been incurred on account of it."

- 79. But besides the views of Government officers regarding the benefits conferred upon the Poona districts by the survey settlement, I am glad to be able to quote the opinion on the subject of that talented public servant, the late Professor Green, who, as the special correspondent of the Bombay Gazette, undertook in 1852 the work of reviewing the whole history and progress of the survey settlements from their first introduction up to that date. All the Government records containing any information upon the subject were placed at his disposal. He was also furnished with statements exhibiting the working of the settlement in the several districts to which the measure had been extended. Every facility indeed for elucidation of the subject, as he readily admits, was placed at his disposal.
- 80. Mr. Green's review was afterwards published in the form of a pamphlet, entitled "The Deccan Ryots and their Land Tenure." After showing the financial effects of the settlement, he sums up the general results of the measure in the following terms:—"And if we conceive the problem proposed to have been to show that equalized and greatly reduced rates, with a liberal and fixed tenure, would lead to an increase of cultivation—an increase so extensive as completely to compensate the Government for its large remissions of revenue—we must admit that the extreme liberality of the settlement, and the skill and care with which it

has been conducted, have been rewarded by the most entire success. If we enter upon the much larger question of the general progress of the people in industry and wealth, then, very satisfactory as this increase in agricultural industry is, we shall still evidently require to seek out answers to the three remaining questions in the list with which we concluded our fifth article."

- 81. The following are the questions referred to above :-
- 2nd.—Has there been a corresponding increase in other branches of production for the same market?
- 3rd.—What is the increase of exports from the districts to which the new settlement has been introduced?
  - 4th.—What, since the introduction of the new settlement, has been the history of prices in the district?
- 82, 'Mr. Green seems to have been strongly impressed with the belief that low as the assessment was, it would still be found that the increased production consequent on the spread of cultivation which had everywhere followed the settlement, would so glut the market that the fixed money payment would be found too heavy for the cultivators to meet. Referring to this subject he observes—
  - "It is altogether impossible that a people raising merely bulky and coarse agricultural produce should ever be able to pay a money revenue of any amount, and not only so, but they themselves, however liberally treated, can never be otherwise than wretchedly poor—in favourable seasons living perhaps in rude and coarse abundance, but reduced to poverty and distress at the occurrence of every unfavourable one."
  - 83. And again, in reference to the same subject, he says-
  - "The one point to bring out is the importance, both to the Government and the people, of the production of exports. The simplest change which could be brought about—the variety of industry which, as resembling most nearly what he already practises, the ryot would most easily fall into—is the raising of commodities for the foreign market from the soil.

The Hindoo is now known to be much more docile than was formerly believed, and we cannot help thinking that something like the agricultural schools, model farms, and itinerant agricultural teaching which have lately been doing so much good in Ireland, some adaptation of them suitable to India would not be found beyond the power of our Revenue Secretary and revenue survey officers to bring into existence. The successful introduction of an export which should bring money into the province, and raise general prices to the extent of only one shilling on each acre of revenue produce. would be a second boon almost as great as that of the settlement itself, and would richly pay for much unsuccessful, or partially successful, previous experimenting. We do not think that any unfavourable augury is to be drawn from the little success which has attended some of the ill-conceived experiments to improve the products of the province which have already been made. Where the Grant Medical College, the Elphinstone Institution, and the Poona College succeed, we do not see why an agricultural school, if attempted with all the light on the subject which may now be obtained from home need be under much apprehension of failure."

- 84. Mr. Green finally sums up the result of his inquiries in the following manner:—
  - "1st.—The reduced rates appear almost everywhere to be followed by a rush on the land, and far more land is taken up than the ryots have properly capital for, leading, as a necessary consequence, to a great deal of very slovenly cultivation.
  - instance, a period of reaction. Cultivation carried on without sufficient capital exhausts the soil, and a fime usually arrives when the land reported in the annual revenue returns as thrown up during the year from 'poverty and exhaustion'—that is to say from the poverty of the ryots and exhaustion of the soil—to which may perhaps be added, though this is

less certain, from the discouragement arising from glutted markets, exceeds the new land taken into cultivation during the same year.

"3rd.—This reaction—this unfavourable balance of lands thrown up over new lands taken into cultivation is in no case very important in amount; the gross produce, in spite of the imperfect tillage, being, from the greater breadth of land under cultivation, decidedly greater. Agricultural capital does everywhere on the whole increase, as do also, although (except perhaps in Dharwar) very much more slowly than could be wished, the exports which are to relieve the overstocked makets.

"4th.—In the best districts some improvement is perceptible in the style of agriculture and in the implements in use among the people, the result of increased means and of an increase of independent feeling and energy on the part of the ryot. We have already noticed the successful introduction of New Orleans cotton, and of a modification of an American saw-gin; and we may here add to them the rapidly-increasing number of convenient light two-wheeled bullock carts—a conveyance introduced into these provinces by our revenue officers. The only collectorate from which we have been able to obtain returns under this head is the Sholapoor one; and for that district the statement is as follows:—

1834-35, number of carts in the district.... 430
1846, do. do. .... 1,907
By last returns, do. do. .... 2,643

"Also in Kurmalla, a talooka previously included in the Nuggur Collectorate, but now combined with Sholapoor—

1846, number of carts in the district..... 391
By last returns; do. do. ..... 983

"5th.—There is, on the other hand, everywhere adamentable amount of indebtedness, and of a thraldom to money-tenders most depressing in its effects on the ryots' energies."

But this again is certainly diminishing in the best districts, and perhaps also very slowly in the others.

- "6th.—Although whoever sets himself to look for pauperism and misery in the province may find quite enough of them to excite the most painful feelings in him, and although the five shillings an acre of returns from the land, and the shilling or 15 pence of rent, tell a most sorrowful tale of wretched unskill, unenergy, and unproductiveness generally, and cry aloud to us to do whatever may be in our power to increase the intelligence and to raise the industrial character of the people, yet, leaving individual cases, and perhaps peculiarly unfortunate talookas, and looking to the result in the mass, there are certainly quite unmistakable indications of the effect that the tide is slowly turning. We have already stated many of these, and will only here refer our readers again to the rapidly-increasing exports and imports, and especially to the large and growing absorption of silver and copper-a fact which can only, we believe, be explained by supposing that in some of our districts silver ornaments and copper vessels—the indisputable signs of growing prosperity in a Hindoo community—are decidedly on the increase."
- 85. Captain Wingate, who was in regular correspondence with Mr. Green whilst preparing the review, considers his summing up of the results of the measure to be not so favourable to the survey as the actual state of the districts would indicate. The following remarks are extracted from one of Captain Wingate's letters to Mr. Green upon the subject:—
  - "I am quite at one with your other critics as to the perfect fairness of your whole representation, and your summing up agrees in the main with my own views, though considerably less favourable to the survey. The following suggestions will explain the points on which I am at all doubtful of the validity of your results. I will take your six paragraphs in order:—
  - "1st.—The deficiency of capital may have been compensated by increased industry, and the evidence seems to show

that it was so to a considerable extent. The slovenly cultivation referred to under this head is not, I think, proved, unless it refer to the new land taken into cultivation immediately following the introduction of the new settlement.

"2nd.—I am not satisfied that cultivation, carried on without sufficient capital, exhausts the soil. It is not, in my opinion, the want of capital so much as a bad style of farming that exhausts the land. It is continued cropping without manure that does the evil, and the greater the capital employed in this style of farming, the more rapidly will the exhaustion proceed, because the heavier will be the crops taken off without anything being given to the soil in return.

"3rd.—The remarks on 1st paragraph apply with greater force to this. I am not aware of anything in the evidence that supports the conclusion that, after the reaction, the land in cultivation is more imperfectly tilled than before the settlement; this is a point to be established by testimony more than by statistics. Frere's account of Indapoor and my own observation, if not overbalanced by the evidence of equally competent witnesses, lead, I think, to the conclusion that improved tillage is a general result of the survey settlements. and consequently that a gross produce has been increased by this as well as by an extension of cultivation. A further inference from this would be, that agricultural capital increases not slowly but rapidly. Without having seen your appendix on prices I am not in a position to offer an opinion on your conclusion, that the markets are overstocked. Prices in this country are ultimately dependent on the necessity of exporting enough to meet our home charges, and this will probably always keep them at a low standard.

already given apply also here. I may as well mention in this place that I greatly understated the number of saw-gins sold to natives in this collectorate (Dharwar) in a former letter. I have now obtained from Mr. Blount, the Superintendent of Cotton Experiments in this province, the following information.

torate up to the present time, which may be relied on as

- "Total number of gins sold—192." Price of the whole Rs. 19.305.
- "The first sales were made in 1848, so that in four years the cotton dealers of this collectorate have invested 20,000 rupees in the purchase of these machines. This is, I think, a fact worth recording, and I wish you could manage to substitute it for the former incorrect allusion to the number sold.
- "5th.—I agree entirely with you in regard to this head. Have you noticed a sad illustration of its correctness in a report published in the Bombay Gazette of 6th instant, of a village money-lender in the Sholapoor Collectorate having been murdered by some of his debtors, under circumstances that give strong grounds for suspecting that the whole body of villagers approved of the deed? This casual withdrawal of the curtain for a moment discloses a state of things quite appalling, if we consider the case, as it is to be feared we must, as a result of the general relations which our administration of civil justice has brought about between debtor and a creditor in agricultural villages.
- "6lh.—I question the propriety of the use of the word pauperism in the paragraph, and doubt if any inquiry would discover anywhere in the surveyed districts the existence of what is termed pauperism in Europe. I understand the word to refer to a state of things in which the able-bodied and willing to work can find no work, and would starve but for the aid of others. I cannot recollect having ever met with this in any of the surveyed districts, and should say that pauperism is unknown in them all. Pauper cultivators, in the phraseology of revenue reports, are to be met with, but these are bankrupt farmers, and they would have no difficulty in finding work as labourers. If you refer to the

<sup>\*</sup>Nore.—Of these, five were purchased by European dealers and the rest by natives.

latter, it would be desirable, I think, to explain the sense in which you use the word.

- "With these few reservations your conclusions seem to me to be as sound as the whole tone of your review is eminently fair and impartial."
- 86. These extracts of Captain Wingate's letter seem to me to furnish satisfactory proof of Mr. Green's summing up being scarcely so fair towards the survey settlement as the state of the district would at that time indicate. It is exceedingly difficult to form an accurate estimate of the condition of any class of people merely from statistical and oral evidence unchecked by personal observation; and Mr. Green was placed in this position, as I believe he never had an opportunity of visiting the interior of any of the Deccan districts.
- . 87.1. Captain Wingate, on the other hand, speaks from his own personal observation, and he also alludes to some notes upon

\* Our present Governor Sir Bartle Frere, G.C.S.I. and K.C.B. the state of the district drawn up by Mr. Frere\* from observations in a tour made through the district about this time. No one could well be better qualified to judge

of the state of this district than these officers, who had resided there almost entirely for the year or two preceding the introduction of the settlement. Carrying away with them a lively recollection of the effects of the previous mismanagement, they would naturally perceive at a glance any important changes which had taken place in the interval between their first and second to the district.

88. But deferring to Mr. Green's judgment, we find that he even admits that "improvement is perceptible in the style of agriculture and in the implements in use among the people—the result of increased means, and of an increase of independent feeling and energy on the part of the ryot." And again, he says, "leaving individual cases and perhaps peculiarly unfortunate talookas, and looking to the result in the mass, there are certainly unmistakable indications to the effect that the tide is slowly turning."

- 89. It seems to me, then, to be fully established that up to this time a considerable improvement had taken place in the condition of the people since the settlement had been in operation. Both Captain Wingate and Mr. Green are at one on this point. They differ, however, as to the measure of this improvement, the former giving a much broader range to it than the latter was prepared to admit.
- 90. The tide, which is said to have been "slowly turning" in 1852-53, has continued to flow on in a stream of prosperity, checked occasionally, however, by unpropitious seasons. The great rise in the price of grain has been instrumental in bringing about this result. The staple product (jowaree), which at this time (1852-53) was selling at the low price of 56 seers for the rupee, had risen in three years' time to 32, being an increase of 75 per cent. to the cultivators' returns. It continued pretty steadily at this price for the next six or seven years; but in 1862-63, when the great rise in cotton began to spread abroad wealth in the agricultural districts, it went up to 16, and has remained pretty much at that price ever since.
- 91. The completion of the made-road between Poona and Sholapoor, and its opening for traffic throughout the whole distance, which took place subsequent to the period referred to in Mr. Green's review, was also a measure which aided materially in developing the resources of Indapoor. But this great source of improvement has since been eclipsed by the opening, in 1862, of the Railway, which traverses the northern part of the district.
- 92. But we must turn to our statistical information to show us the effects of these important measures upon the condition of the people and the general state of the district.
- 93. We should naturally suppose that the first signs of an accumulation of capital amongst the agricultural class would be shown by the construction of permanent works for the improvement of the land; and accordingly we find that the repair of old and the construction of new wells early engaged attention.

94. According to a statement prepared from the Mumlutdar's records I find that at the time of settlement there were 312 wells in the district. Of these, 366, or somewhat less than one-half, were out of repair and useless. Half of these (184) have subsequently been put into working order, and 625 new wells have been constructed. The following tabular statement will serve to indicate these results more fully:—

Total	Deduct Wells	Remaining in	Old Wells	New Wells	Total present
No. of Wells	out of	working	subsequently	subsequently	No of Wolls in
in 1835-36.	repair.	order.	repaired.	constructed.	working order.
812	366	446	184	625	1,255

- 95. The construction of 625 new wells and the repair of 184 old ones, in a district which numbered but 446 wells 30 years ago, represents a marked increase in this class of useful and productive works. Keeping pace with the growth of capital, the expansion of these permanent improvements progressed but slowly at first, six, eight, and ten being the number of new wells annually constructed, and there is one year (1846-47) when the return shows three only. Latterly however, or since 1860-61, there has been a large expenditure of capital on these works. In one year (1862-63) 66, in another 57, and taking the last six years of the lease I find that an aggregate number of 291 new wells have been opened out for irrigation.
  - 96. We may assume that each of these new wells represents an outlay of Rs. 400. I much question, indeed, whether it would be possible to dig a well and face it with stone-pitching according to the ordinary plan of construction for that sum in the present day. A cultivator too, when a small capitalist, would, as a general rule, take a pride in building a fine well; and I am sure there are not of the new ones that I have seen which must have cost at the double the abovementioned sum. But assuming our first timate to be fair, the 625 new wells represent a capital of two and a half lakhs. And if we assume roughly that the repair of

the old wells has been effected at a charge of from Rs, 150 to 175 each, we may add about half a lakh more to our estimate, which would make up the outlay of capital on this source of improvement to three lakhs of rupees.

97. The building of new chowrees and dhuramsalas is another source of general improvement in which the cultivators of this district have expended some portion of their new capital. They are unremunerative works, it is true, but they add to the social comfort of the people, and to their ideas raise the general status of the village. The following is a return of the works of this description which have been recently constructed:—

Description and No. of Buildings,	Contribution by Government.	. Ryots' payment.	Total Cost of Building.	
	Rs.	Rs.	Rs.	
Chowrees, 59	3,182	10,240	13,422	
Dhuramsalas, 27	• 1,334	11,512	12,846	
86	4,516	21,752	26,268	

98. The present value of land represents another addition to the material wealth of the people of the district ascribable to the settlement. It has been shown in the first part of this report that prior to the introduction of that measure there were hundreds of acres lying waste and unprofitable which no man cared to cultivate, owing to the oppressive nature of the assessment and our defective system of revenue administration. All these broad acres have not merely been brought under tillage, and thereby rendered profitable to the State, but their occupancy right has become a valuable private property. In proof of this I would refer to the results of the several land sales which have taken place during the last two years, embodied in the following statement:—

Nime of Villagis	Number of separate Sales official	7 alue of	and assessed of the Land corned		Amount realized by Sale.		No. of years' purchase of the assessment for which Land was sold.	
		,A. չts	Rs.	a.	Rs.	a.		
Ind spoor Gagu gaum Pimpree Khurd Dauz Ponowree Oodhut Pullusdeo Bigwun Kullus Rednee Neerwangee Baodch Birat Nithbgaum Wurkhoota Boodrock Gopee Suratee Agolee Nimbgaum Ketkee Ajotte Muddunwaree Rooce Baboolgaum		341 2 29 27 11 21 74 4 32 39 11 24 108 30 23 37 78 31 30 35 32 6 74 53 8 6 5 25 30 75 31 26 30 71 31 26 30 71 31 20 35 21 20 21	22 12 54 6 22 7 12 29 7 16 8 15 18 9	11 10 10 13 11 10 6 10 10 11 10 6 11 7 7 7 11 11 11 11 11 11 11 11 11 11	800 275 75 115 550 300 128 200 300 12 40		31 21 16 27 11 3 7 13 66 10 9 7 64 10 8 8	
Total	48	1,223 30	404	12			-	

- 99. The return comprises sales effected in 22 villages scattered over different parts of the talocka, and may therefore be said to be a fair estimate of the average value of land; and according to the data therein given, the right of occupancy in land held under the settlement is now worth seventeen years'

  Total assessment purchase of the assessment. We may 81,175×17=13,79,975. consequently assume that the private property pertaining to the occupancy of land now vested in the inhabitants of the district represents a capital of upwards of thirteen and a half la'.hs.
- 100. Combining our several estimates of the value of the permanent works and property in land created by the improvements

effected during the currency of the lease, I find that they amount to the large sum of above seventeen lakhs, as shown below:—

	ь.	•	Rs.
Estimated	value	of new wells (para. 96)	2,50,000
Do.	do.	of old ones repaired (para. 96)	50,000
Do.	do.	of chowrees and dhurumsalas (para. 97).	21,752
Do.	do.	of occupancy of land (para. 99)1	3,79,975
		Total Rs. 1	7,01,727

101. For information as to the extent to which the floating capital of the agricultural class has been augmented by the measure, I would refer to the statement appended, exhibiting for each village of the district the result of two different census of the inhabitants, cattle, agricultural implements, carts, &c., taken respectively in 1835-36 and 1865-66. The following is a summary of the results therein detailed:—

Description.	Numerical Reto Census	turn according taken in	Increase in farour of 1865-66.		
	1835-96.	1865-66.	Numerical.	Percentage.	
Inhabitants	40,179	52,830	12,651	31	
Bullocks employed in farming operations	17,673	20,976	3,303	18	
Cattle of other descriptions.	27,002	24,565	2,437	4) decrease.	
Carts	291	1,165	874	300	
Ploughs	1,454	1,820	366	25	

<sup>102.</sup> Referring first to the population, which is the real motive power by which all improvements are effected, I find that the numerical difference between the two returns given is 12,752, being equivalent to an increase of 31 per cent; or, speaking in

round numbers, we may say the population is one-third more than it was thirty years ago. As compared with other countries the ratio of increase is small. In England the population is said to double itself in rural districts in fifty years, and market-towns and large cities show a much larger increase.

- tion of the district is very sparse, as it bears the low proportion of only 101 souls to the square mile. There is certainly rather an unusually large proportion of unculturable land in Indapoor; but deducting this, and making our estimate on the culturable area alone, the average number of inhabitants is still only in the ratio of 119 to the mile. This shows a marked contrast to some of the Gujerat districts, where, according to returns given in one of the recent settlement reports, there are 522 souls to the same given area; and this, I may observe, combined with the general fertility of soil, serves to explain the reason why a district in Gujerat can pay such a much larger revenue than a poor and thinly-populated Deccan district.
- of about 18 per cent. to the number of cattle used for agricultural purposes. Considering the large expansion of cultivation during the abovementioned period, the increase is less than might have been expected. The season, however, in which the enumeration was made was very unfavourable in the Kullus division of the talooka, and a good many cattle had been sent away to other districts for grazing, and a good many also sold for want of fodder. The number returned is therefore somewhat less than the cultivators ordinary stock. But we must expect this source of floating capital to be fluctuating in a district with such an uncertain climate—to decrease, in short, in seasons of scarcity, and increase again in seasons of plenty.
- increased three hundred per cent.; that is to say there were only in the district in 1835-36 and there are now 1,165. I have bready given an account of Lieutenant Gaisford's proceedings in

constructing a new model of a light country cart. The perfect success which has attended his exertions is shown by the remarkable fact that the old lumbering machine with stone disc wheels has disappeared from the face of the land, the present stock of 1,165 being all made after the pattern originally introduced by him.

- but they serve a most important end in effecting a distribution of produce, being extensively employed in the transport of grain: During great part of last season they were transporting grain from the Nuggur districts, where it was comparatively cheap and plentiful, to the drought-stricken district of Uthnee in the Belgaum Collectorate. This year their services will, I fear, be required in supplying their own districts, where unfortunately the season has been very unfavourable. This transport of grain furnishes a profitable source of employment to the cultivators, and at the time too when their services are not required for field work.
- 107. I trust the remarks in this chapter, though imperfect in many respects, will nevertheless have so far served the object in view as to indicate generally the effects of the settlement upon the condition of the people and the resources of the district. I shall now therefore turn to the consideration of the more immediate subject of my report, viz. the revision of the present settlement, or, in other words, the new rates of assessment to be imposed upon the district.

## PART III .- Revision Operations and proposed Rates of Assessment.

108. The execution of an entirely new survey of the district has been the first step taken in connection with the revision. The present settlement, as has been already explained, was based upon Mr. Pringle's survey, which, though considered a good survey at the time Messrs. Goldsmid's and Wingate's settlement operations were carried out, would be thought a very imperfect measure in the present day; and no superintendent of survey would venture to impose an assessment based upon such imperfect measurements.

- 109. To show the degree of accuracy considered sufficient in those days, I need only refer to Messrs. Goldsmid's and Wingate's memorandum explaining their operations. Speaking of the test or partial measurement of villages undertaken with the view of ascertaining the general correctness of the survey, they state as follows:—" If the result of this investigation tended to prove that the contents of the fields thus visited had been estimated with tolerable correctness at the time of the survey (say within ten per cent. of the truth), it was for the time assumed that the whole lands of the village had been in the first instance correctly surveyed."
- 110. In the present day measurements are considered faulty, in an open country like Indapoor, if errors of three per cent. are met with; and the average difference between test and original measurement is generally, as a rule, not above one per cent. in our survey's.
- 111. But independently of faulty measurement, the former survey was defective in other important respects. What these defects are has been already explained in a report to Government, recommending an entire re-survey of the district preliminary to the revision of rates. The following are the remarks here alluded to:—
  - "But independently of a want of accuracy in the actual measurement of the land, Mr. Pringle's survey was in other respects a most imperfect measure. It was confined for the most part to culturable lands, and did not generally include within its operations gairan and hill tracts. The survey officers did not consider it necessary to remedy this defect at the partial revision of the work alluded to above, and consequently there is in many cases no record in the present settlement paper of the area of the above kinds of and. The operations too were imperfect in another important respect, in that they were not executed on a plan admitting of the preparation of a village map."
- 112. The following statement, exhibiting the results of the measurements of part of a village according to Mr. Pringle's and

according to the present survey, may be taken as a fair specimen of the errors to be met with in the former work:—

*	<u> </u>	•						
		AREA AC	CORDING	TO	Dipperence			
Survey Nomber.		Pringle's	l'resê:	nt Survey.	In	Per Cent.		
	A cres.	Goontas.	Acres.	Goontas.	Actes.	Goontas.		
1	9	22	8	11	1	11	13	
2 3	25	O	85	4	10	4	40	
3	16	33	18	7	1	14	8	
4	13	8	16	30	3	22	27	
5	20	34	24	18	3	24	17	
6	1	38	2	11	0	13	16	
7	2	36	2 4	<b>3</b> 8	0	2	2	
8	3	37	4	6	0	9.	G	
9	2	30	3	24	O	2 9 34	. 31	
10	13	14	14	0	0	26	2 6 31 5	
11	17	3	16	38	U	5		
12	9	12•	10	6	0	24	6	
13	13	17	9	6	4	11	32	
14	17	20	• 18	39	1	19	8	
15	22	2	16	12	5	30	24	
16	16	8	30	25	14	17	89	
17	29	20	<b>a</b> 36	17	6	31	23	
18	35	19	44	39	9	20	27	
19	9	• 5	17	27	8	22	94	
20	35	10	30	0	5	10	15	

113. It is due, however, to Messrs. Goldsmid and Wingate to explain that the large errors in their survey now brought to light are not so much attributable to actual faulty measurements of individual fields, as to the circumstance of the field boundary-marks—which were not erected till the lapse of ten or twelve years after the settlement had been introduced—not having been erected according to the actual limits to which their survey was confined. No supervision being exercised over the work, and there being no maps whereby the boundaries of fields could be identified, the erection of the boundary-marks was consequently left almost entirely to the cultivators. The result was that, as a

rule, wherever gairan land adjoined a cultivated field, a portion of it was included in the boundaries of the latker.

114. This practice was carried to such an extent that

Village.	Gairan Acres meluded in cultivated Fields.
Bhowra	2,093
Kullus	1,863
Shetphul.	1,668
Neergoreh.	1,456

hundred of acres of gairan have been thus absorbed in many villages. A few instances of the kind are given in the margin. Where boundaries have been changed in this manner in the interval between the two surveys, there can of course be no area agreement between the two operations; so that what appears now as a serious error in the former survey is in reality in many cases the result of the plan on which the boundary-marks were

erected. The existence, however, of such encroachments is of course one of the best reasons for a re-survey.

- 115. In dismissing this question of the incompleteness of the former survey, I desire to explain particularly that my remarks have been made entirely with the view of justifying the re-survey of the district, and I should be sorry indeed were they to be read as reflecting on the operations of my predecessors in the survey.
- should be conducted formed a subject of considerable discussion. Captain Nasmyth, the officer in charge of the Trigonometrical Survey party in Bombay, was consulted specially upon the point as to how the work should be executed so as to be useful hereafter for the operations of his department. Colonel Rivers, who has had considerable experience in the Trigonometrical Survey, was also consulted on this point. The result of these deliberations is set forth in the following extracts of my letter upon the subject:—
- "6. With regard to the plan upon which the new survey should be carried out, it has been felt that our present system of operations, though well adapted to ensure an accurate record of the extent of the sub-divisions of land com-

prised in our field survey, would be improved were our work incorporated with the Topographical Survey, so as to produce a map of the country based upon points fixed by the latter. I have been directed to consult with Captain Nasmyth, of the Trigonometrical Survey, and Colonel Rivers (who served for some time in the same department), as to the system by which the operations of the two branches of the survey could be amalgamated so as to carry out the object stated above. Both these officers have kindly drawn up a memorandum on the subject which I subjoin:—

## Captain Nasmyth's Memorandum.

- "'To make the revenue survey measurements useful to the Topographical Surveyor, it would be necessary that the former should commence from, and close upon fixed and easily recognizable points.
- "'2. Detailed instructions are given in Colonel Thuillier's Manual of Surveying; but generally it may be remarked that the revenue surveyor ought to connect his measurements with all stations of the Trigonometrical Survey, or points fixed by it within his reach. The position of these—their latitude, longitude, and azimuth—can always be got by application to the Surveyor-General. Failing trigonometrical points in the district under survey, the revenue surveyor should connect his work with any temples, remarkable trees, or other easily recognizable points.
- regularity, and should record the comparisons of the chain? Copies of each successive day's work should be forwarded to the Superintendent's office, where it would be examined and plotted, so that there could be no tampering with the books.
- 4. Where angles are measured with the theodolite a similar system shall be pursued, and all observations should be taken at opposite faces of the instrument as a check upon gross errors, and to show always the state of the callimation of the instrument.

- if used with carbonic acid paper, would admit of the registries being recorded in duplicate by one operation, and the plotting of the work from carefully kept field books might be effected at any subsequent time with as much ease as at the time of the measurements being made.
- "'6. There must ever be intermediate processes in the preparation of a map of the country between the trigonometrical and revenue surveys, those, viz. by which the large triangles of the former are broken up into smaller ones, the roads and rivers traversed, and the features of the country contoured; but the boundary measurements of the revenue survey might very well be turned to account, and the cost of repeating them saved.'

## Colonel Rivers' Memorandum.

C:

- "I have read Captain Nasmyth's Memorandum on the subject of incorporating the work done by the revenue survey into a topographical survey, so as to produce a map of the country.
- "'2. The connecting link should, in my opinion, be traverses taken with theodolites of roads and circuit boundaries either of villages or groups of villages. These traverses should be taken by the revenue surveyors, as they will know the boundaries, but they should be checked by trigonometrical points.
- "3. These points should be fixed by the trigonometrical or topographical party; there should not be fewer than one in every four square miles. Every conspicuous temple, tree, or other object should be fixed, and if no conspicuous objects exist to that amount, artificial marks should be erected. They abould be entirely dependent on the principal triangles of the trigonometrical survey, and the revenue surveyors should make no attempt to lay down trigonometrical points from their chain-measured bases.

- trigonometrical party to the revenue surveyors, the field works will proceed; but the field books should be sent to a mapping office, where these circuit boundaries and high roads shall be laid down by the aid of the trigonometrical points.
- "'5. These traverses may therefore be considered rigidly correct, and the adjoining circuits cannot fail to fit accurately, which they never would if dependent on chain-measured traverses alone.
- "'6. Within these boundaries the field maps of the revenue survey will now be laid down. Errors in the latter will doubtless become apparent, but the traverses will show in what direction the errors lie, and they will be reduced to an amount quite inappreciable in the mapping office.
- "'7. In the ordinary open country of the Deccanhaving the roads, the village boundaries, and the field maps, nothing else seems required; but of course in many places sketching parties will also be required to delineate the topographical features of the country, and this should be done in sheets in which the traverses and the trigonometrical points have been laid down.'
- "9. To carry out this plan of combining the operations of the two surveys, it will be necessary for me to furnish the topographical branch with an outline map, showing the circuits of villages and the points fixed. It will then remain with them to take up as many of these points as may be suitable to their work, but sufficient to ensure the preparation of a district map. In Sind the settlement and the topographical survey are carried on upon this plan. The objection to the plan in this case is, that the corrected copy of the district map cannot be prepared till the country has been topographically surveyed."
- 117. The traverse survey system proposed in the correspondence quoted above has been carried out throughout the district. One of the chief results of the measure is the preparation of a dis-

by the Revenue Survey Department. The more accurate construction of the village map has also been ensured by the measure, whilst at the same time it forms a check upon the general correctness of the aggregate detailed field measurements of the village, as any considerable difference between the total area of the village by the latter plan and its total area computed from the traverse survey would indicate faulty measurement which might not otherwise be brought to light.

118. The following comparative statement exhibits the results of the new and former survey shown in detail under the same heads:—

									*
	GOVERNMENT LAND.			Alien	ATED	å			
	Culturable.	Unculturable	Garran and unassessed.	Total.	Culturable.	Unculturable	Total.	Roads. Tanks,	Giand Total
Present survey	270,076	18,095	18,679	<b>306,</b> 850	13,854	1,163	15 017	13,805	335,672
Mr. Pringle's do	238,135	17,912	43,653	299,700	13,881	765	14,649	272	314,621
Increase	31,941	183		7,150		398	368	13,533	21,051
Decrease	••		24,974		30				
	<u> </u>	<u> </u>		<u> </u>	<u></u>			·	

On examining this statement it will be seen that the difference in total area between the two surveys is not so much as might be expected from the faulty nature of the detailed field measurements given in paragraph 112, being only about 63 per cent. There is, however, the large difference of 31,941 acres between the two returns of culturable area. This is of great importance as regards our re-assessment operations, for it shows that this large area has hitherto been held rent-free as it were, being in excess of the former assessed area.

ments has been ensured by a careful test taken by the European

- assistant. In this, operation, however, there is nothing to record as differing in any respect from the practice now generally followed in our surveys.
- 120. I was hopeful at first that Messrs. Goldsmid and Wingate's classification, which was a new measure and carried out regularly throughout the whole district, would serve as the basis of the new assessment. A careful examination, however, of the work has elicited considerable discrepancies in valuation. These discrepancies are attributable in many cases to the difference in area between the measurement of fields as now made and as originally recorded, adverted to in a previous paragraph. To remedy this defect I tried the plan of re-classifying all fields where the difference in area between the two surveys exceeded a given percentage. But it was found that this plan would not ensure a complete correction of the errors ascribable to this cause, and moreover it involved the rather difficult operation of adjusting the present valuation to the former standard adopted by Messrs. Goldsmid and Wingate.
- 121. What is here stated will perhaps be better understood if we take as an example the case of a field of which the area has been found on re-survey to be 40 instead of 30 acres, as per former survey. We may suppose the increase to be the result of a change of boundaries. It follows therefore that there are 10 acres of which no valuation was made in the former classification, but which have now to be classified, as forming an integral part of the field. Now if these 10 acres are poor soil and the rest of the field middling good, the former valuation would be incorrect, as we put a fixed average rate on each field based on an estimate of all the different varieties of soil it contains. Suppose, for instance, that the average rate of the 30 acres is 8 annas worked out by 15 shares of 2 acres each, and that 2 annas per acre is the value of the 10 additional acres. Now to arrive at an average value of the whole field, we require to add the corresponding number of shares which these 10 acres represent, which is five, to the aggregate value of the former shares. The following will be the result thus worked out :--

- 122. If therefore the former rate of 8 annas per acre were applied to the 40 acres, which is the assessable area of the field according to re-survey, it would be over-assessed to the extent of 1½ annas per acre, which would be equal to an addition of Rs. 3-12-0 to the assessment of the whole field. Greater discrepancies than this might occur, for I have taken the case of an 8-anna field, whereas a 12-anna one might be subject to the same error in valuation from difference in area. The above, however, shows sufficiently the importance of having the classification based upon all the varieties of soil comprised within a field.
- 123. But besides this, Indapoor is the first district in which a regular classification of soils was attempted by the Survey Department, and the plan of operations, as may be readily supposed, was rough at first starting. We have been unable to make out, with the accuracy desirable in such matters, the precise standard of valuation adopted. It seems to have been different in the Kullus (where operations were commerced) to that of the Indapoor Division, subsequently classified. There would have been difficulty therefore, attended with the risk of inequality of assessment, if we had kept the old classification and endeavoured to adjust our valuation of fields re-classified to the same standard.
- 124. All things considered, it has seemed to me to be safer and more expedient in several respects to make an entirely new classification of the district based upon the improved system of operations which, with the experience of the past thirty years, has been introduced into the Survey Department since Indipagr was first classified.
- 125. The work has been carefully tested by an assistant, and both the Superintendent, Major Waddington, and myself have subsequently personally examined it in several villages.

- 126. Having explained the preliminary measures of the revision operations. I shall next proceed to show how I propose to fix the new rates, their amount, and their effect upon the revenue of the district.
- dating back thirty years from the present time must naturally include not metely an adjustment of rates, but a consideration of the general principles upon which they were fixed. Our plan of settlement operations, though rough originally—and it may be said perhaps experimental only in Indapoor—has now been fully established; and experience, whilst giving confidence gained from successful results, has enlightened us on many points which seemed to the first projectors of the measure to be beset with difficulties. But apart from this, the principles to be made specially applicable to the revision operations now yearly to be carried out throughout the Presidency have to be defined.
- 128. In the first place I think it should be understood that at a revision settlement a new grouping of villages should be made, should circumstances seem to call for such a measure; and the cases will be rare, I think, where the circumstances of the district have not undergone such marked changes during the currency of the thirty years' lease as have materially altered the condition and rateable position of particular villages.
- villages will be—the state of present communications as compared with those existing at the time of the original settlement, and the establishment of new markets, or the decline of those which were the principal ones when the first grouping took place. Many changes will be required on these accounts. The railway insome districts has not only opened out new communications, but been the means of establishing new markets; and on the other hand it has changed first-class markets into second rate ones, as with Panwell and Bhewndy in the Tanna districts, by the diversion of the traffic and trade to which they were indebted for their prosperity as market-towns.

- 130. No change will probably be required on account of climatic influences, though this point should be fully considered on re-assessing a district; for in the earlier fixed settlements attention was not directed to this important subject to the extent it has been latterly, and to the extent, too, that is essentially necessary for an equable distribution of rates of assessment.
- 131. This re-grouping should, in my opinion, be carried out generally according to the rules prescribed under this head in the following paragraph of the joint report:—
  - "Para. 67. In determining them upon the extent of the country to be assessed at uniform rates, we are of opinion that the more permanent distinctions of climate, markets, and husbandry should receive our chief attention. We should not think of imposing different rates of assessment on a tract of country similarly situated in respect to these three points, in consequence of the actual condition of the cultivators varying in different parts of it. Were we to do so, we should depart from the principle laid down by the Honourable Court of Directors of assessing land according to its capabilities, and adopt the objectionable one of doing so with reference to the means of the person holding it. The effect of such a system, by creating different rates of profits upon capital employed in agriculture, would interfere with its natural and most advantageous distribution by diverting it from land actually in cultivation to the lowly-assessed waste of those villages of which the cultivators happen to be poor. By enabling the latter to meet the Government demand without the application of the same degree of capital and skill required in the case of better cultivated villages, it would foster in the former a slovenly and unremunerative mode of husbandry. By taking into account an element so uncertain and liable to change as the condition of the cultivators in particular villages, the assessment would become less and less suitable with every imrprovement in their condition. On the other hand, by basing the assessment on considerations of a durable character, we have the promise of its remaining suitable for a lengthened

period, and at the expiration of the term for which it is confirmed require no further alteration than a simple increase or decrease of its amount as the exigencies of the country and Government might demand."

- 132. But in applying these general principles I am of opinion that we should make some special reduction to meet the circumstances of the case, when inquiry shows that a village in a certain group has not prospered to the same extent as adjoining villages of the same group, though enjoying like advantages from the ad interum improvements made during the lease. This should not be done, however, until a searching inquiry has been made, and it has been clearly ascertained that the original classification is correct, and upon the standard adopted in the adjoining villages.
- being bad cultivators and not so careful of their resources as their neighbours, no reduction should be made. But if it should appear that some natural causes have operated in bringing about the result—such, for instance, as occasional flooding from the mundation of a river—I think it would be impolited to ignore the result of thirty years' experience, and keep such a village in the class to which it would belong by the application of the rule for the sake of preserving a general uniformity of rating.
- 134. In the Deccan districts cases of the kind will be rare probably, but in the Concan there will, I think, be occasion for the exercise of the exceptional treatment here advocated.
- respect to the treatment of improvements made with the cultivator's capital. The survey rules preclude the levy of any extra assessment during the currency of a settlement lease on account of the enhanced value of land resulting from such improvements; and the same ruling has been embodied in the part of the Survey Act relating to revision operations, the following being the provision inserted in the concluding part of Section 30:—"Such revised assessment shall be fixed, not with reference to improvements made by the owners or occupants from private capital and

resources during the currency of any settlement under this Act, but with reference to general considerations of the value of land, whether as to soil or situation, prices of produce, or facilities of communication."

- 136. There may perhaps be some difficulty in determining precisely the kind of improvement which is to be exempted from assessment at the revision. There are some improvements which obviously come under the rule: the construction of a new well, and the conversion thereby of dry-crop into garden land, and, in the same way, the repair of an old one during the currency of the settlement. These are both cases to which the rule is clearly applicable.
- 137. The planting of trees, which in some districts would give an increased value to land, is another proper exemption from enhanced assessment. And, except in cases where rules have been made specially providing for the re-survey of rice lands at the expiration of the lease, or where rice 'land is held under special conditions, I should consider that new rice land—made out of Jerayet or dry-crop cultivation land at the ryots' expense—is not assessable otherwise than at Jerayet rates, provided the land was so assessed under the original settlement.
  - 138. These are clear and obvious cases, I think, in which the enhancement of assessment on account of improvements is specially barred. The class of improvements about which some doubt may perhaps exist is that affecting lands, which, originally assessed at the ordinary dry-crop rates of the district, have become valuable during the lease as building sites, owing to the increased accommodation required for an enlarged station, or other similar causes. Such is the case with the lands in the vicinity of Poona. This special value being, however, attributable to extraneous circumstances, and to improvements which have been brought about mainly at the expense of the State, I am of opinion that enhancement of rates is perfectly justifiable in such cases:
  - 139. The enhancement should, however, be regulated by a general rate applicable to building ground, and not by a special one

for each case. If the latter course were adopted, and a higher rate imposed with reference to the character of the building and its rateable value, we should then be departing from the leading principle of the rule, and taxing individual improvements.

- when appropriated to building purposes or utilised for quarrying is treated of under Section 35 of the Survey Act. The rules formed under the provisions of this section provide for the levy of a certain charge, regulated by the character of the district, when land is appropriated to either of the above purposes. These rules will have effect during the currency of present leases, but at their expiration I think a building rate is to be preferred to an upset payment. Under the section referred to the assessment of land appropriated to the purposes indicated above is declared to be "hable to revision at any future settlement of the district." This, I think, renders legal the imposition hereafter of a building rate separate from the land assessment, as advocated above.
- 141. The foregoing suggestions appear to me to embrace the main principles by which our revision operations should be guided, and I shall now endeavour to show how they should be combined in the revision of the Indapoor rates with the other circumstance affecting the question.
  - 142. I shall take up the general question of communications first. A marked change in this respect has taken place during the thirty years. When the settlement was introduced there was not a mile of made road in the district. The first great improvement was in the construction of the present imperial line of road from Poona to Sholapoor, which runs through the centre of the district passing by the town of Indapoor. From its construction till the opening of the railway (to be alluded to in the sequel) this road has been an immense advantage to the district, and is so still indeed, though its importance has been materially diminshed by the latter more civilized means of communication.
  - '143.' The road has served not merely as the means of bringing Poona, which is the great grain market of this part of the

Deccan, and to which all the other markets are more or less subsidiary, within easy means of transport for grain, but it has brought great part of the villages of the district in direct communication with their own great local market. • It has also been the means of establishing a regular cart traffic between Poona and Sholapoor, which has enabled the ryots to take advantage of any rise in either of these markets when their own has been glutted or unduly depressed.

- 144. The opening, however, of the railway line from Poona to Sholapoor in 1863 has had a great effect, not merely on the Poona road, but upon markets and prices also. The railway, as was to be expected, has driven the cartman off the road, and monopolized his perquisites; and so long as its rates are fairly regulated with reference to the value of produce, as well as its transport cost by road, the Company will remain the great market carriers of the produce of this district.
- 145. The diminution of traffic upon this line of road has considerably affected the importance of Indapoor as a markettown generally. Situated midway between Sholapoor and Poona, dealers exporting produce to either station would naturally try the half-way market. Many a maund of grain and many a cart-load of merchandize intended for one or other of the above markets has been disposed of in transit at Indapoor, and the return carts laden with some articles of produce which would command a better price in the respective markets. The general business of the place has certainly suffered from the causes here alluded to, though as a local market it is still almost as important as ever, commanding the produce of the district generally. I should consider therefore that, as regards our new rates, the market may be said to be as important as it was thirty years since, though it has somewhat declined since the railway was opened.
- 146. A great revolution has taken place in the price of grain during the currency of the lease. We learn from the reports of the survey officers that jowaree, the staple product of the district, was selling at 66 seers the rupee in the year in which their rates were introduced; the average price of the five years preceding is said

to have been 53 seers per rupee. The following table exhibits the average yearly price in the Indapoor market during the cur rency of the lease:

Year,	Jowaree, No. of Secre per Rupee.	Bajree, No of Saers per Rupee.	•Year.	Jowaree, No. of Seers per Rupee.	Bajree, No. of Seers per Rupee.	Year.	Jowaree, No. of Seers per Rupee.	Bajree, No. of Sears per Rupes.

Ten years'			Ten years'			Ten years'		
average.	561	37	aveiage.	453	351	average.	261	22

- 147. During the first ten years of the lease but little change took place. Prices ranged from 72 seers in 1843-44 to 36 in 1845-46, whilst the average for this decennial period is  $56\frac{1}{2}$ . The first year in the next decennial series was a most unfavourable season, and grain rose to the rate of 15 seers the rupee. It speedily fell again, and had gone down to 72 in 1849 and 1850. A steady increase set in from this date, and it was selling at 32 in 1855-56. The average for this period is  $45\frac{2}{4}$ .
- 148. Beginning with 32 seers in the last decennial period of the lease, but little fluctuation occurred during the earlier years, and down to so late as 1861-62 27 seers was the ruling sate. The general rise of prices which has spread throughout the Presidency dates from this period. Its effect was felt here, 16 seers being the rate in 1862-63, and there has been but little change since. The average price for this period is 26½ seers.

- 149. We must consider present prices to be exceptional-to be the effect in fact of that commercial prosperity which has The export of cotton from resulted from the American War. that country being suspended by the war, India was called upon to furnish the supply required for the English market, and she set herself vigorously to the cultivation of that product. Indapoor is naturally not a cotton-growing district, but reports of the large profits realized from its cultivation having reached the ryots, they naturally turned their attention to its growth; and from returns obtained from the Mamlutdar, I find the large area of 30,049 acres is under cotton cultivation this year. A considerable area has thus been diverted from the growth of grain during the last few With a diminished supply there has been increased consumption, consequent on the spread of that wealth which has been poured into the country by the large profits realized from cotton. These cuses operating together have been mainly instrumental in bringing about the present high prices, which therefore I think it safe to consider exceptional.
- 150. To sum up the results of the changes affecting the new rates which have taken place during the lease, grain has risen from 66 to 55 seers the rupee; or, taking the average of the last ten years, the rise will be from 66 to 26, which is equivalent to above 150 per cent. It is difficult to put a special value upon the increased facilities of transport resulting from the ad interim improvements. There is no doubt they have aided materially in bringing about the rise in the price of grain, and may therefore be included generally under the advantages which are ascribable to that measure.
- 151. The climate of Indapoor has unfort mately, however, prevented the cultivators from realizing that material wealth which is indicated by the immense rise in price of grain referred to above. The rain-fall is most precarious. For two and three consecutive years together it is either insufficient, or the falls so untimely, and at such long intervals apart, that no crop is brought to maturity. Such has been the case with part of the Kullus division. A good average crop every other year is too liberal an allowance as an

average of the general run of seasons. From the Jummabundy reports it would appear that the cultivators get a good crop about once in three years; that of the other two, one is a year of almost complete failure, and one of middling crops only.

152. It is only within the last few years that pluviometers for gauging the rain-fall have been introduced into inland districts. I have been able to get but five years' returns for Indapoor, which give the following result:—

				In.	cts.
Year of	1861-62,	total fall gauged		2	50
Do.	1862-63,	no return		0.	0
Do.	1863-64,	total fall gauged		<b>3</b> .	18
Do.	1864-65,	do.		11	40
Do.	1865-66,	do.	• •	6	<b>95</b>
Do.	1866-67,	do.	• •	5	24.
				29	27
		•		-	-
$A_{V}$	rerage fall	for the five year	s	5	85

This speaks volumes regarding the climate; for what can be said of a district which has an average rain-fall of somewhat less than six inches per annum!

- 153. But it will be said that the climate is no worse now than it was thirty years ago, and consequently that this point does not affect the question of what the present rates should be. I admit this, but at the same time think it is necessary for me to explain to how great an extent its uncertainty has affected the condition of the people by operating against the benefits which would otherwise have accrued to them from the rise in prices. The problem then which we have to solve is this—when, or at what period during the currency of the lease, had the cultivators acquired that amount of capital which is essentially necessary for the proper cultivation of the land and their own well-being, and what was the price of grain at that time?
- the settlement that, at the end of the first decennial period, the

cultivators were not in a position to pay a higher assessment had a revision taken place at that time. The average price of grain for the ten years is 56 seers per rupce; consequently we may conclude that the assessment was not light when gauged by the prices of that period.

- 155. In our remarks upon Mr. Green's review, which took place six years after in 1852-53, we have come to the conclusion that though a decided improvement in the condition of the people was noticeable at that period, no considerable accumulation of capital had taken place. The turning point had been past, and the steady rise in prices which set in from that date soon made a marked change in the state of the district. The revenue was being regularly paid without remissions, and as indifferent seasons occurred at that time, its payment shows that the cultivators had some funds to fall back upon, and were not entirely dependent on the crop of the year.
- 156. I think therefore we may fairly assume that towards the latter end of the second decennial period the cultivators had acquired that amount of capital and that well-to-do position which we would assign to them as the measure of profit to be left after payment of the Government assessment. I am consequently of opinion that we may take the average price of grain during the latter half of the second decennial series as the index by which we may estimate from prices what our present assessment ought to be. In other words the percentage increase which has taken place during the last ten years will represent generally the percentage addition to the present assessment which may now be made.
- 157. Applying this rule to the case, I find the average price of grain for the two periods indicated stood as follows, viz:

We may assume approximately therefore that between 50 and 60 per cent. is the addition (considered solely with reference to the price of grain) which may now be made to the present assessment.

- 158. I find that a maximum rate of one rupee per acre, with a reduction of 2 annas for some villages and a special increase of 2 annas for Indapoor itself (details to be explained in the sequel). will give about the required amount of assessment. Twelve annas is the maximum on which the present assessment is based. increase to a rupce is equivalent to an addition of 33 per cent. only. But it has been shown that according to the new survey a considerable extent of land has hitherto been held in excess of the assessed area. The assessment now placed upon this, and the assessment resulting from the adoption of a comparatively higher standard of valuation for the best soils, form a special fund of increase to our new settlement. And these sources, swelling the general amount, raise the percentage increase higher than is indicated by the difference between a twelve and raupee maximum rate. That is to say by the application of the latter rate to new measurements and new classification the assessment will be raised to 53 instead of '33 per cent., which is the actual difference between the two given rates.
- 159. I have satisfied myseli by inquiries, as well as by returns of the state of the crops, that the rain-fall is not equable throughout. It is evidently somewhat larger and more certain in the south-east corner of the talooka, extending beyond Indapoor, and embracing the country along the banks of the Bheema, than in the western part of the district, extending from beyond Kullus, to the Baramuttee villages. The three last seasons furnish striking transless of this. Round about Indapoor, and in the tract of country first indicated, the rain-fall though small has been timely and sufficient to essure an average good crop, whilst for the same period there has been almost an entire failure in the villages round about Kullus.
- 160. It has been suggested to me that the more certain rainfall in the part of the district referred to is ascribable to its position

with reference to the Mhadeo Hills in the Sattara Collectorate. The rain-clouds, gathering round their sumplify in the monsoon, pass off into the plain in a south-westerly direction, which brings them over this corner of the Indapoor district; whilst on the other hand the Kullus part of it lies too far west to come within the bearing of the south-west wind blowing over these hills. This doubtless is one of the reasons to which this change may be ascribed; but the whole valley bordering on the Bheema River seems to get more late as well as more early rain than the villages near Kullus alluded to above. I may not have indicated the real cause of this difference in the rain-fall, but that a difference does exist is beyond doubt, and I consider that it forms good grounds for fixing a lower rate for this part of the district.

- 161. There are 13 villages thus circumstanced for which I propose a maximum rate of 14 annas only, whilst for the rest of the district my rate is a rupce. Owing, however, to the advantage which the cultivators of Indapoor derive from their own market-town, I propose an addition of 2 annas to the rate of that village, which consequently will be Rs. 1-2-0.
- But besides the regular Jerayet or dry-crop cultivation for which the abovementioned rates have been fixed, there is a small extent of land immediately on the banks of the Bheema River which is annually flooded by the flushes of the river during the monsoon season. This flooding has a very fertilizing effect, and moreover renders the cultivation of this tract certain and independent of the regular rain-fall. Hitherto in the Deccan districts we have made the rates of this land 4 annas in the rupee, or 25 per cent. higher than the Jerayet rate of the village. Experience has satisfied me that this is relatively a much lower rate than it should bear. I propose therefore to make an addition of 50 per cent. to my Jerayet rate in the present case; that is to say to make Rs. 1-8-0 the maximum for this flooded land. Even this is below the mark; but I think it politic to let the cultivators have this land dayourable rates, for it forms a small reserve which helps to read their resources when the crops upon the ordinary Japayet and fail. and the first and the contraction of the second

assessment according to my proposed rates, as, owing to the classification of the district having only just been completed, there has not been time to calculate the assessment for each village in the regular way. But the following statement, compiled from the detailed returns, gives an abstract of the approximate result which has been worked out from the rough classification papers:

Assessment according to Do.	proposed present	-	Laud.	Total. 124,700 81,391
		43,322	13	43,309

According to this statement the new rates will make an addition of 57 per cent. to the present assessment of the district. But with this addition the average rate upon the whole culturable area will still be only 7 annas 8 pies per acre.

- 164. The rate of increase varies considerably in individual villages. In one case it amounts to 150, in several it is about 100, and in some it is only 17 and 18 per cent. Amongst the Rupee class villages it ranges generally from 50 to 100 per cent. The
- village of Nimbgaum Ketgee, near Indapoor, shows one of the smallest increases. This is owing to its having a considerable extent of well-garden land, bearing a special rate for which there is no corresponding entry in the new assessment, as no special rate (as will be shown presently) will be placed upon wells in future.
- 165. In the 14-anna rate villages the increase varies generally from 25 to 50 per cent. There are one or two places where it is less, and one or two cases where it is more than the abovementioned rate. This variation in undivided villages is attributable to the difference between the new and the former survey, and the difference also between the two standards of classification. There

The collection last year amounted to Rs. 83,502, but this includes Rs. 2,318 restized from suffery sources, independent of the regular assessment, and our comparative statement is confined to the latter account.

can be no doubt of the fairness of charging for land when proved by actual survey to be either in excess of former recorded area, or to have been undervalued originally.

- 166. With regard to the recent classification, I should here explain that great care has been taken to keep down the valuation of the lower orders of soil. A lower scale of values has been adopted specially for them, and this will have the effect of making them lower upon the Rupee than under the former 12-anna scale. During the course of my inquiries about the present rates on different soils, I was frequently asked what I intended doing with the poor burruds; for although the cultivators about Indapoor seem to be prepared to expect a general increase of about 50 per cent., the prevailing opinion appeared to be that none of this increase should fall upon the poor soils; and such will be the effect of our recent classification operations.
- 167: There has for some time been a general impression abroad that our survey rates in many of the early-settled districts have been pitched proportionately higher on the poor than on the good soils; and experience has led me to think that there are grounds for supposing this to have been the case to some extent. I have borne this in mind in revising the rates of the district, and am satisfied that no complaints of the kind will be tenable against the classification operations as carried out in Indapoor.
- 168. But besides prices, we have other collateral evidence which tends materially to confirm my opinion of the suitability of the rates of assessment now proposed. The evidence here alluded to is that which is supplied by rates introduced in adjoining districts subsequent to the date of the Indapoor settlement.
- Talooka, belonging to the Ahmednuggur Collectorate, which was settled by Captain (now Colonel) George Anderson in 1853. His maximum rate for the villages bordering on Indapoor was only 12 annas. One rupee was the highest rate imposed in the talooka, but owing to the bad climate of the villages referred to the their rate was reduced to 12 annas.

170. The settlement of Indapoor is alluded to in the following remarks:—

"So far as I could ascertain from inquiries made during the settlement, the 1yots of the survey districts on the other side of the Bheema appear to have derived much benefit from the 1evised assessment, and I am inclined to hope that the new 1 ates will prove equally beneficial in Kortee. In Indapoor especially the 1yots, so far as I could learn, are thriving and contented. In Hingnee—one of the Kortee villages settled by me—a 1yot of Indapoor was found to be cultivating 82 acres of land. He told me that all the land in his own village had been taken up for cultivation; he could only, on becoming more prosperous, enlarge his farming operations by crossing the river and taking up land in Kortee. He now travels on horseback from one village to the other, and I daresay considers himself quite a gentleman farmer."

- 171 Captam Anderson had access to the records of the Indipool settlement. His proceedings in Kortce may therefore be taken as evidence that up to the period referred to (1853) Indapoor did not show such marked improvement in its condition as to rend i it advisable to impose a higher rate in an adjoining district of similar climate and capabilities.
- districts, which have been comparatively recently surveyed and assessed by the Survey Department under Colonel W. C. Anderson, the present Survey Commissioner of that Collectorate. Referring to his operations I find that the Nateepootee Division of the Khatao Talooka, which adjoins the Bheema on the borders of the Indapoor Talooka, was assessed in 1858-59 at a maximum rate of a rupee; and the same maximum was applied in the following year to the tract of country, belonging to the same talooka, lying between the Mhadeo Ghats and the Neera River, and extending to the Phultan Desh on the west. I should be inclined to think that the circumstance of part of this last-mentioned district being nearer to the Mhadeo Hills may possibly give it some little superiority in point of climate over the western part of Indapoor, which it

- adjoins. Both are proverbially drought-striken districts, and this is especially the case with the country near Phultan. It is an old saying in the country that rain never falls in the Phultan Desh. This of course is metaphorical, though it is wonderful how little does fall in that ill-favoured country.
- 173. Prices, it is true, have gone up a little since these districts were assessed, but, as already explained, they have been in an exceptional state lately, and it would be unsafe to take the three or four last years' returns as the basis for a settlement to be fixed for 30 years. The prices of 1857-58 and 1858-59 are the average upon which my rates have been fixed; and as Colonel Anderson's settlements, made at that time upon a Rupee maximum, are working well, there is every reason to suppose that Indapoor, with its more favourable position in regard to markets and communications, can bear the same rate.
- 174. With regard to the assessment of well-garden land, it has been already shown by extracts from the correspondence upon the present assessment that there was at that time (1836-37) a diversity of opinion upon this subject; Government apparently retaining their objections to the measure, but giving their consent to it on the understanding that the rate was fixed so low that the cultivators would readily pay it. The plan of fixing a low rate has been carefully observed throughout our well-assessment operations, and this course has, no doubt, prevented any opposition to the measure.
- 175. The cultivators seem to have been impressed with the belief that the guarantee given in the joint report rules, exempting new wells from assessment, would extend only to the end of the present lease. Considering therefore the large number of new wells which have been constructed—as shown in a preceding parametric parametric parametric parametric parametric parametric production and arrangement, I think the time placed on well-garden cultivation; and such an assurance would greatly stimulate a further outlay of capital in the construction of this class of permanent and useful works.

- 176. It is a most impossible to overrate the importance of well cultivation in a drought-stricken district like Indapoor. When the country is parched and unproductive from the want of the monsoon rain-fall, little spots of cultivation may be seen here and there dotted about the lowl-ying lands of the village. This cultivation, which is the product of the small supply of water stored in the wells, is often the sole product of the village in such seasons.
- 177. There may be financial difficulties in disposing of the existing assessment on well-garden cultivation in some districts, and I would not therefore ask for any general ruling applicable to all cases. But as there is no such difficulty in Indapoor, and as Government have recently expressed their wish to have present practice in assessing well cultivation modified, I feel no hesitation in proposing the entire abolition of the special cess in this case.
- 178. The course adopted by me is to put the first class Jerayet rate upon all land capable of being irrigated from existing wells, irrespective of the value assigned to it by the Jerayet classification. But when the land has been classed at the full Jerayet rate, no addition has been made in consideration of its being irrigated by a well. Government wish a general addition to be made to the Jerayet rates of all lands possessing a water-bearing stratum; but it is almost impossible, I think, to work out this plan in the ever-varying soil of the Deccan. I have therefore taken existing wells as the guide, and considered only the land under them as having a water stratum.
- 179. The assessment given in a former para represents the amount of imperial land revenue imposed upon the district; but in addition to, and independent of this, a separate cess of one anna per rupee will be levied for local improvements. Section 29 of the Survey Act provides that the guarantee given to a settlement shall be limited to the imperial land revenue, the Governor in Council being empowered to impose any cess that may be deemed requisite for local improvements. I cannot help thinking that this power of increasing the demand upon the land by the imposition

at any time of a special cess will have an injurious effects for it is entirely subversive of that guarantee which has been intentified the main sources of the popularity and success of our present settlements. I refer to the guarantee of no addition being made to an assessment during the currency of a settlement lease. I fear our agricultural classes will not understand the distinction between imperial and local land revenue, as laid down in the test; and any addition made to the latter by the imposition of a special cess after the introduction of a settlement would assuredly create a feeling of general distrust.

- 180. It appears to me that the provision for increasing the revenue for local purposes, contemplated in the Act, is a condition which might fairly be reserved to the State were a permanent settlement to be introduced. But in a 30 years' lease I think it is a matter of the greatest importance that the full demand to be realized, imperial as well as local revenue, should be declared, and the provision referred to does not appear to me to preclude the adoption of this course, for the Governor in Council, in the exercise of the right reserved, may, in my opinion, declare that, for a stipulated period at least, no addition shall be made to the local, in the same way as with the imperial, land revenue. I would urge the adoption of this course for Indapoor, one anna being declared to be the maximum amount leviable during the new lease.
- 181. At the time the present assessment was introduced the question was warmly discussed, as to whether the settlement lease should be given for ten or for thirty years, and, as has been already explained, the decision was eventually in favour of the latter period. If there be any question in the matter now, it would be whether we should renew our agreements with the cultivators for thirty years, or adopt a permanent settlement.
- 182. The question of a permanent settlement has been a fruitful, topic of discussion of late years, especially since the advocacy of the measure by the late. Colonel Baird Smith in his able report on the Eamine, of 1860-61 in the Bengal districts. The sacrifice of public revenue which is involved in departing the

State from any share of the increase in the rentable value of land resulting from a rise in the price of agricultural produce, is the great objection urged against the measure; and in the districts in this Presidency, where an extremely light assessment has been fixed, it would apply with great force. It would appear, however, from Colonel Baird Smith's remarks, that the state of things is altogether different in the provinces of Bengal, for the assessment seems to have been already fixed there at the full measure of the State's demand.

- 183. Referring to this point Colonel Baird Smith observes -
- "It may be supposed that a great sacrifice of public revenue is involved in the concession of a perpetually fixed demand on the part of Government. It is to be observed, however, that (with a single exception to be noticed separately) the recent tendency of the measures of Government has shown a different conviction, and indicated a benef that its interests are best secured, not by general enhancement, but by general lightening on its demand on the land. latest order under which settlements now in progress are conducted prescribe a reduction of the proportion of the rent or net produce hitherto appropriated as Government revenue from 66 to 50 per cent; and I have no doubt that this is a wise and prudent step, sure to justify itself before many years pass away. It is scarcely possible indeed that a tax on rent which, even at its minimum, absorbs half that product, and presses exclusively on a single section of the community, can be permitted to increase. The tendency will, I believe, be quite in the opposite direction, and instead of desiring to raise the moderately assessed districts to the level of the highest, the best revenue authorities will probably seek to lighten the pressure on the latter, and in this manner, rather than by the converse process, to equalise the burden generally."
- districts, for which the permanent settlement was proposed, and our Presidency generally as regards the pitch of assessment originally imposed. Indapoor, which we are now revising, is naturally

one of our least favoured districts. Its average rain-fall is so start and uncertain that I have now been required to discount. Itherally on this account; but still circumstances, in my opinion, have fully justified the imposition of an increase of above 50 per cent; in that case even. In other districts (where the assessment will soon come round for revision) enjoying a certain and fair average rainfall, as the province of the Southern Maratha Country for instance, the future increase to the public revenue is probably not over-stated in being estimated at 100 per cent., and the rates which will give this increase will still leave the cultivators a full and ample margin of profit for the acquisition of capital.

- 185. But after making this increase, are there not good grounds for supposing that, on the return of another revision at the expiration of thirty years, we may again legitimately increase our demand upon the land? No one, I should think, would venture to state that a maximum rate of one rupee per acre represents, notwithstanding its precarious climate, the full assessment which Indapoor can bear. I cannot see that the State is called upon to forego these prospective advantages. The public expenditure connected with the Government of the country is annually increasing, but our annual revenue has not of late kept pace with the demands upon it. It seems to me, in short, that it would be almost as unreasonable to ask the Chancellor of the Exchequer to fix the excise taxes in perpetuity, as to require the Bombay Government to introduce a perpetually fixed demand upon the land!
- 186. I would therefore recommend that the proposed assessment of Indapoor be declared permanent and unalterable for the term of thirty years.
- 187. I have now explained all my proposals affecting the revision of the present assessment; but before closing this report. I would offer a few remarks on questions affecting the success of the settlement and the well-being of the people.

#### · General Remarks.

\*\* 444

188. It will, I trust, have been made evident, from the general tenomof my remarks, that a remarkably short and capricious

rain-fall has had a very material effect in retarding the prosperity of the Indapoor district. In short, that, unless we can cure this lasting defect, it can never attain to a permanent state of prosperity. Capital will accumulate in cycles of good seasons, to disappear again, however, to a considerable extent as each unfavourable cycle comes round.

- 189. Irrigation is the only means of remedying this defect; and I would here draw attention to the importance to this district of a project \* recently brought forward by Government Colonel Fife for damming up the Moota Selections. Lingation Series No. II River in a locality about 12 miles west of It is calculated that the head of water which will be raised by this work will furnish a supply for irrigating the country from Poona to a distance of nearly 100 miles eastward, extending throughout a considerable tract of Indapoor. To a droughtstricken district irrigation, which will afford a supply to compensate only for the regular rain-fall, will be inordinately valuable. But how incomparably greater will the value of a supply which can be obtained after the season for the monsoon falls is past; and Colonel Fife's project would do this. It would supply water sufficient for raising a rubbee crop; and instead of Indapoor being at this season a parched and barren-looking country, with scarcely a trace of vegetation, we should see crops ripening with the golden autumn tint upon them.
- 190. I have estimated that 2 rupees per acre might be levied as an average rate for all lands for which water would be available for a rubbee crop. The estimated supply would raise the average outturn fully tenfold in excess of the ordinary monsoon crop produced. Instead of having to fight against seasons, pledging his land to the money-lender in bad, and paying off the debt in good, the cultivator could calculate on his regular annual return of produce, and would soon become independent of such pernicious assistance.
- .191. But besides the actual supply of water obtainable from the canal, an increased supply would be afforded to the wells of

this, connected with the new James Canal in the Khandeish Calling lectorate, has recently come under notice. Wells that were dry before the canal was opened have now a good supply; making which had ordinarily little or no water at this season have a good running stream in them; and thus not only directly, by means of the canal, but indirectly also has this work been the means of spreading a supply of water throughout the country; and equally important results may be expected to follow upon the extension of Colonel Fife's project to the Indapoor district.

- 192. Supplemented by a work of this kind, the district would rapidly attain to a state of prosperity under the assessment now proposed. The horrors of famine would for ever be averted; and the people, whilst accumulating wealth, would become large contributors of the articles of export produce, and consumers in an equal degree of the manufactured imports—the cotton and the woollen goods, and the hardware articles—which form the staple wealth of the British manufacturer.
- 193. I cannot conclude without expressing my apprehensions that in this review of the Indapoor settlement I have not done justice to the services of Messrs. Goldsmid and Wingate, the great pioneers of that system of survey and settlement, which, originating in Indapoor, has now been extended with most beneficial results throughout the length and breadth of the Presidency. Death has long since laid his hand upon the former. Suffering from an acute disease, he was proceeding to England for the recovery of his health, but midway between the land of his labour and the land of his birth he was summoned to his last home, and has been laid to rest in the cemetery in Cairo. But though dead to fame, the name of Goldsmid—"Nana Sahib", as he is familiarly styled in Indapoor—is regarded with feelings of veneration and the deepest respect by the ryots of that district as the great reformer of abuses, and the originator of the "Paimash" settlement.
- 194. Lieutenant Wingate, speaking of him as in the time of the Indapoor settlement, after serving with marked distinction for .

some years in the Survey Department, maturing its operations, and inaugurating many useful reforms in the revenue system of the Presidency, eventually retired from the service in 1853. Living in retirement from public life, his valuable services in this country had long remained unacknowledged by the State; but on the recent creation of additional classes of the Exalted Order of the Star of India, it was pleasing to his many friends in this country to find his name amongst the list of the distinguished servants of the State whom Her Majesty has been graciously pleased to appoint to be Knights Commanders of the Exalted Order of the Star of India.

I have the honour to be,

Sir,

Your most obedient Servant,
J. FRANCIS, Lieut Colonel,

Survey and Settlement Commissioner.

J. FRANCIS, Lieut. Colonel,
Survey and Settlement Commissioner.

### Appendix I.

To S. MANSFIELD, Esq.,

Assistant Collector, in charge of Indapoor.

Sir,—In doing myself the honour of reporting on the Revision of the Survey and Assessment of the Indapoor Pergunna, I feel little hesitation in expressing the favourable opinions of it contained in the following pages, since the praise and credit due to its projectors, and the contrivers of its system, fall to others. The plan for its execution had been laid down before I received charge of my present duties; the elements also of the settlement had been determined, and, in a portion of the pergunna, had been combined into the finished assessment.

- 2. Of the plans adopted for revising and correcting the survey measurements, re-classifying the lands, ensuring accuracy in returns and reports, checking the work performed by subordinate agents, and conducting all other details of business, Messrs. Goldsmid and Wingate had already given ample memoranda to the Principal Collector. These, coming, as they do, from the officer who contrived the arrangements, must be much more satisfactory than any description of them I could give. I shall therefore altogether omit this part of the subject in my present report, and shall principally confine my observations to the principles on which the revision of assessment has been conducted, its results as connected with Mr. Pringle's and the Mamool settlements of the district, and its effects on the condition of the people and the revenue of Government.
- 3. In following out the system of revising and correcting the survey measurements, described in the memoranda above alluded to, it was found necessary to re-measure the whole lands out of the 86 villages in the pergunna. The soil of nine out of these 17 villages is so continuously good, and consequently the

boundaries of the various fields so fixed and well defined, that the errors discovered there can only be attributed to mismeasurement on the part of the carkoons employed by Mr. Pringle.\* That these mismeasurements were wilful there can be little doubt. since Government were in all these cases losers by them; and this idea is confirmed by the discovery, that several of these villages were entrusted for measurement to the same carkoon. other 8 villages the line of demarcation, in many fields, between the arable and unarable land is dependent on the fancy of the cultivator, and in consequence it is so variable as to render it impossible that measurements made at any great intervals of time should correspond; but even in these villages I am inclined to think the mismeasurements in many instances wilful. remaining 59 villages of the pergunna the survey measurements seem to have been executed with very tolerable accuracy and fidelity. This circumstance is, I believe, to be attributed to the inexperience, in the act of exacting bribes, of the carkoons who measured it. With one or two exceptions none of them had ever been previously employed in any other pergunna.

4. It was determined by Government that the acre should †Government letter No. 2056 continue the standard land measure of of 1835, paras. 14 and 15.
† Government letter No. the pergunna; † that Mr. Pringle's mea-

2056 of 1835, paras. 16 and 17-§ Revenue Commissioner's

§ Revenue Commissioner's letter No. 1162 of 1835, para-11, and No. 898 of 1835, para-15. continue the standard land measure of the pergunna; that Mr. Pringle's measurements should be retained; and that the determination of the rates of assessment should be left to Mr. Goldsmid. ‡ It appears, however, that, in conformity

with Mr. Goldsmid's first views of the subject, it was imagined that only three or four rates would be established. §

<sup>\*</sup> In most fields an error of even 10 per cent. in the measurement affects the assessment no more than a difference of half an anna in the rate per acre. For instance, take a field of 40 acres, and let the rate be 5 annas. The proper assessment on it is 5 times 40, or 200 annas. Let it be mismeagured as containing 44 acres, and at the same rate, the assessment will be  $41 \times 5 = 220$  annas; let it be misassessed at  $5\frac{1}{2}$  annas; and the assessment will be  $5\frac{1}{2} \times 40 = 220$  annas. Both these results differ from the proper assessment by 20 annas. Accuracy within half an anna in the classification can never be expected, and therefore, though perfect accuracy would be desirable, measurements within 10 per cent. of the truth are not to be considered as out, of keeping with, or as vitiating the rest of the work.

5. These rates were considered necessary by the native

\* Revenue Commissioner's letter No. 502 of 1835, para-37; Mr. Shortrede's letter, dated 15th January 1835, para. 13.

governments, and also by those of car own countrymen best fitted for judging on the subject, \* to form an assessment possessing the proper degree of minuteness of valuation on the basis of the

Chahoor, a measure which has been described by Government as being, roughly speaking, equal to 120 beegas, but as deviating on both sides of this limit according to the quality of the lands. It will not therefore appear surprising that, on the substitution of the invariable acre for this pliable and accommodating measure, a close examination into the nature of the soils in the pergunna and their comparative productive powers showed that minuteness of valuation could now only be obtained by the introduction of a greater number of rates.

- of the first survey to adopt nine rate, instead of following the native custom of using only three. But however this may be, it was now found that, for the purpose of assessment, the division of the soils into three colours, each colour containing three sorts would be sufficiently minute, and that it would possess the advantage of not being altogether unknown to the carkoons to be employed in the work of classification and the people whose lands were to be assessed.
- 7. One of the most difficult operations in making an assessment is to determine with accuracy the proportion by which the levy from different sorts of lands should be regulated; and a false system here seems to have been one of the chief defects of the first survey. It is observed by the Revenue Commissioner "that the great objection urged by the people to the survey rates is the increase which they have imposed on the inferior lands, while on

the superior lands they have effected a letter No. 502 of 1835, para. reduction.† This general and universal hardship cannot be accounted for even by the numerous causes of error and defect exposed by Lieutenant

Shortrede; it is so general and universal that we must look for its cause in the system, and not in the execution, of the survey.

9. The survey rates were fixed at 55 per cent. of the net profit on land; and of this system the disproportion above alluded to appears to have been the natural effect. Assessing fields at a percentage of the net profit was, in fact remunerating the cultivator, not in proportion to his labour, but in proportion to the value of the field on which he laboured. To show how unequally, by this system, people requiring the same funds for their support were remunerated, I have calculated, from the survey papers of 13 villages in the Indapoor Pergunna, the sums which, had the survey been conducted, in other respects, on right principles, would have been left with the respective holders of fields of the nine kinds of soils, so differing in size as to require each an annual expense of 5 rupees for their proper cultivation. They are as follows:—

lst Black	2nd Black,	81d Black	1st Red.	2nd Rod	Sid Red	lst Burtud	2nd Burrad	3rd Burrud
Rs. a. p.	Rs. a. p.	Rs. a. p	Rs. a p.	Rs. a. p	Rs a. p	Rs. a. p	Rs. a. p.	Rs. a p.
2 11 11	2 8 7	1 3 5	195	1 4 8	0 15 4	0 15 10	0 10 3	0 6 10

The fair sum to have left with each of the owners of these fields, as calculated from the same papers, would have been somewhat more than one rupee.

9. In fixing the rates in the Indapoor Pergunna care was taken to avoid this error. Lieutenant Shortrede has well explained in the 72nd, 73rd, 74th, 75th, and 76th paragraphs of his report on the revenue survey, dated the 24th October 1835, the liabilities to error which must invalidate the results presented by the long and tedious method of estimating in numbers the expense and profits of cultivation; and in his 109th and 110th paragraphs he proposed two other methods of graduating an assessment—one "founded on a portion of the gross produce, decreasing from the rich to the paor soils;" the other by determining on the spot, by means of persons possessing "some experience and tolerable judgment," assisted by the cultivators, what rate per acre the "soil of each

particular field will bear." The expression, "assessing each at what it will bear," corresponds, I imagine, to the one made use of by the Honourable Court of Directors when they direct land to be assessed according to its capabilities; and performing this operation on the spot, by the experience and judgment one possesses, is the plan acted upon by the landlord and tenant wherever such a relation exists. But to have visited personally each field in a pergunna containing 220,000 acres would have been the work of at least twelve years, and a plan for shortening this period became absolutely necessary.

- 10. By visiting fields of each of the nine kinds of soil, and determining, with the assistance of those best skilled in agriculture, and by the judgment and knowledge they themselves possessed, what assessment, after taking into consideration the uncertainty of rain and all other circumstances, an acre of each sort of soil could bear, and applying rates thus fixed to returns, prepared and checked with the greatest care, of the quantity of soil of each sort existing in each field, Messrs. Goldsmid and Wingate succeeded in preserving in the assessment the true principle of assessing each field at what it will bear (for its capability), whilst they adopted a plan compatible with speediness of execution.
- 11. The result of their examination was the accompanying table of rates,\* for the fairness and justness of which Government

  \* Table No. 5.

  must principally rely on the known judgment, experience, and knowledge of the individuals who formed it. It will not be deemed irrelevant to the subject, however, if an attempt be made to show by facts that the new assessment of Indapoor, calculated on them.
- 12. The Tunka assessment on the villages in the pergunna, at present in the hands of Government, exclusive of the sums levied by Hucdars, amounted in round numbers to about 1,02,000 Rupees. To this sum adding 20,000 Rupees, as the probable amount of hucs levied directly by Hucdars,

cannot well be objected to either as too high or too low,

\*1,22,000 Rupees. makes under that system the total burden of taxation on the people 1,22,000 Rupees.

The Kumal assessment on the same villages amounted in round \*2,28,000 Rupees. \* The survey assessment, allowing 1,400 Rupees as what would probably have been the assessment on the village of Pondowree, lately fallen in to Government, 184,000 Rupees. See table No. 6. villages, to about 2,03,000 Rupees. † The assessment as now revised amounts to about 84,000 Rupees. ‡

- 18. The supersession of the Tunka by the Kumal assessment is to be attributed, as mentioned in the 9th paragraph of the Revenue Commissioner's letter No. 503 of 1835, to the augmentation of the resources of the country and the depreciation of the value of money since the days of Mullick Amber. The artificially increased population of the 10ving Maratha nation in its glory, and the gold and silver plunder gathered from one-half or India in the Peishwa's camp, sufficiently account for both these occurrences.
- 14. The necessity for superseding both the Tunka and Kumal by a lighter assessment than either may on the other hand be found in the lessened demand for produce, attendant on the dispersion of the Maratha orders of cavalry, and the increased value of money, caused by the ebb from Mahrashtra of the wealth and riches which the tide of fortunate plunder had brought in.
- 15. It is to be regretted that the assessment by Mr. Pringle's survey was founded on the average price of grain during many previous years. The effects of temporary causes were just dying away, and it was the more probable that the price of corn would decrease still further, than that it would be raised to its former height. His assessment of this district was too high. It was even higher than the Tunka, which had been reverted to under Bajeerow in 1807.
- 16. Under a native government, and subject to the extortions of unprincipled and unchecked government servants, it is difficult to say how much the people pay; but whatever may have been exacted by individuals from the people, I do not think that the Kumal assessment has ever been realized by any government

in this district; and this opinion seems to be coincided in by the Revenue Commissioner in his tetter No. 502 of 1835. Taking

- however, even the Kumal as a standard of comparison, it will be found that the corn assessment now and then do not very materially differ. The Kumal assessment of 2,28,000 Rupees was a commutation for 5,472,000 seers of grain, at the rate of 24 seers per rupee; and this rate is not a high one for that time, as table Nos. I. and IV, will prove, in which it may be seen that the average price of grain in 1218, 19, 20, 21, 22 Fuslee, under the light Tunka assessment, was one rupee for 24½ seers. The present assessment of 84,000 Rupees is a commutation for 544,000 seers of the same grain, at the rate of one rupee for 66 seers, which has been the price of grain here for the last two years; or, 4,452,000 seers at the rate of the average price of corn here for the last five years, viz. 33 seers for one rupee.
- 17. In discussing a question of this nature, in which the permanent improvement of the country and the welfare of the people are the great objects to be kept in view, it would seem short-sighted and unfeeling to propose the immediate improvement or otherwise of the Government revenue as a test by which to try a new assessment. The ultimate improvement of the revenue by every fair and liberal measure is an effect which time, we may feel assured, will always show. But in the present instance it is pleasing to point out that Government is an immediate gainer by a liberal measure. Without including sums collected as outstanding balances, the average annual collections in the pergumna from Fusiee 1235 to Fusiee 1245, excluding Fusiee 1242 as a

the table No. IV. year of some scarcity, were 32,802 Rupees; the largest sum collected in any one year of the 14 preceding Fusice 1246, excluding sums levied for balances, was 48,020 Rupees.‡ In the past year (1246) the first year after the commencement of the revision of assessment—the collections amounted to 50,198 Rupees; ‡ and they will probably exceed the sum in the present year (1247).

18" If will not be thought, I hope, after the foregoing para-

From that part of my 16th paragraph which regards the relation between the present and Kumal assessments considered as commutations for grain, and my previous declaration that the Kumal assessment was never realized in this district, it would not at first sight be an unfair deduction that the present assessment is too heavy; but it must be remembered that the people are now free from the extortions, cesses, and jastee-puttees of the host of Deshmooks, Deshpandehs, Patells, and Coolcurnees, who in former days took from them in general the means of paying the Government revenue.

20. Humiliating as it is, it is still a fact, that the Indapoor Pergunna has never till the present year been in so flourishing a condition as it was in Fuslee 1228, the first season after received it from the Peishwa's government. In that season

\* Vide table No II.

† Vide remarks in table-

215,911 beega were under cultivation, a quantity bearing the same proportion to the total number of acres. In the present season upwards of 189,000 acres of land are under cultivation.

21. In Fusice 1245 the remissions in the sub and principal divisions of the Indapoor Pergunna were 4,667 Rupees in the former and 7,911 Rupees in the latter; the outstanding balances for the same year were 160 Rupees in the one and 1,166 Rupees in the other. In Fusice 1246 the new assessment was introduced in the subdivision. In that year, though the amount of remissions in the principal division rather increased, being 4,689 Rupees, the remissions in the subdivision fell in their amount to 1,266 Rupees; the outstanding balances in the principal division also increased to 196 Rupees, while in the subdivision they fell, as compared with the previous years, from 1,166 to 205 Rupees.

Fusice 1246 was 6,557 Rupees; during the 14 previous years they never so small, 1 "

- 22. That a partial introduction of the new assessment should so much diminish the amount of remissions and culances, with that the revision of assessment should increase cultivation to an extent unparalleled during the 20 years, we have possessed the agentry, are strong proofs that the new assessment is not too highest. The cheerful and contented looks of the peasantry, and the improvements in their dress, bear witness to the same point.
- 23. In conformity with the directions of Government on the subject, all lands irrigated from wells have been subjected, to a Bagayet tax.
- 24. It was found impossible to estimate the comparative value of Mothesthul Bagayet lands, among themselves, without referring to the quantity and permanency of water in the wells as the most important circumstances to be considered. Of these and other circumstances connected with each well, tabular documents were carefully prepared, and of the relative value of gardens having certain supplies of water containing certain descriptions of soil, &c., ideas were obtained in a manner similar to that described in my 9th and 10th paragraphs.
- divide the gardens into classes, and fix a certain rate of assessment for each class. But in practice it was found that to determine to which class a well should belong, when this determination rested on seven or eight different circumstances, such as the supply and the permanency of water, the depth and state of the well, the extent of the ground capable of being irrigated, and the extent actually watered at the time of inspection, was a most difficult and complex operation, requiring a greater exertion of judgment and thought than to fix the assessment separately of each was thought than to fix the assessment separately of each was thought the latter plan was therefore adopted. This was those in practice, by fixing for each well a nominal number of acres, all to be assessed at a fixed tent of a rupe of each. This plant was selected as facilitating an operation in which content if acres was refused as facilitating an operation in which content if acres was refused as facilitating an operation in which content if acres was refused as facilitating an operation in which content if acres was refused to the same thing, which has the evidence that it is evidence that the same thing, which the threateness ment the final at

Idnoclinemency or be fixed in acres each of the value of 2 unpect; Thublattania: only an algebraic way of performing the former appearing to ...

The highest assessment, including the Jerayet aste on the landwatered by one mint, has been fixed at 10 rupees. The Jerayet and Bagayet rates have been made distinct, the Hagayet being extra to the Jerayet. The Bagayet assessment has been fixed on the garden, and not on the acre; and the determination of the different shares to be paid by the different partners in a garden has been left to those persons themselves.

- 27. It is hoped that by this system all interference on the part of our native officers will be rendered unnecessary. So many changes are constantly taking place amongst the holders of Bagayet lands that the opportunity of interference on the part of Government servants would open a wide field of extortion to the might have the inclination to practise it.
- 28. The pergunna of Indapoor contains 220,000 acres of land. Its re-assessment has cost Government 8,700 Rupees for carkoons, stationery, &c., and 7,500 Rupees \* for European superintendence. The latter sum would have been considerably less had there been no restriction as to the period in which the former could be obtained.
- 29. It will be unfair to quote Indapoor as an example of the time required for re-assessing a certain number of acres. Want of funds and inexperience combined to delay the work here, so that two years and three months have been spent in the operation.

  30. The duties necessarily imposed on the natives of the establishment have been most arduous; not one of their number has escaped without an attack of fever or guineaworm; most have suffered from both. They have displayed more honesty, persover ance, and ability in their work than I expected to meet with the successful with the suffered concluding this report I hope I shall be excessed for other foregoing paragraphs. I have employed fifteen months,

with attention and interest, in my sluties in this pergonnectand ath unwilling to quit the subject without glancing at its fiture prospects.

- 32. In this country agriculture is in a simple and whimproved condition, and the seasons are uncertain. The price of spain is consecutently always fluctuating, and with it the value of the crops and the money rent of land; to these causes may be attributed the existence of annual settlements, and the custom, with native small proprietors, of letting out land for a share of the produce. While such remains the case it may always happen that a money assessment, which is one year paid with ease, will, if exacted from the reople in the next, take from them a part of their fair portion of the produce of the earth. Hence a necessity for continued and rigilant superintendence on the part of the officer in charge of the district.
- 33. A glance at the annexed table of prices of corn\* will at once convey an idea of the effects political causes have produced during the last thirty years on the value of corn, and therefore on that of land. It cannot be predicted with certainty whether things may not change, as made by Fuslee 1257, as they have since Fuslee 1237, or as they did between Fuslee 1218 and Fuslee 1228. It is urged that political causes are not now at work as they were then; it may be replied that moral ones are. On the expiration of the ten years' leases, now about to be granted, an inquiry should then, I think, be made as to the fairness the assessment may then display.
- natives the existence of a richer class—the class whose wealth and leisure should enable them, to obtain and diffuse knowledge, and cultivate learning amongst them. As permanent causes of this want I may point out the habit of marrying every child early in life, and the law for dividing the property of a parent among the children. The former custom multiplies the claimants of the benefits of the left, and prevents accumulation of property by lapses, &c.; the latter renders it impossible that a family not possessing some means of repairing its fortunes can long remain wealthy. In large

with ease and rapidity, these customs do not appear to injure the condition of society. If one family sinks in importance, and tweath, another rises in its place. But, in the provinces, where their effect is to divide and subdivide all property, as to leave with each individual but a bare sufficiency for support, to make and keep all poor, and then to prevent improvement and perpetuate ignorance.

- 35. Government will derive great advantages from the spur to cultivation which a fair and equitable assessment gives. Cheap corn, it may not be doubted, in a marrying country such as this is will always find and preserve or create consumers; for the wants and miseries which carry off thousands will doubtless be mitigated by it. With population, imports and exports and manufacture must likewise increase. But Government, by becoming the bestower of still more valuable blessings on its subjects, may improve its own resources it a still greater degree.
- 36. Education will, by improving the condition of agriculture, as much tend to equalize and give stability to the value of land and produce as the construction of roads; and by education alone can the causes be removed which prevent the existence of a richer class in the districts. As this class increases, and education progresses, the wants, and consequently the employments, of the people will become more numerous, a greater demand for produce will be caused, and the price of produce will rise with the Government land rent, which, as a commutation for a share of that produce, may be raised also. In short, education appears to me to be as much the means of giving security and increase to the Government revenue, as it doubtlessly is of improving the moral and mental condition of its unenlightened and unfortunate, but yet tenchable, structs.

A. NASH, Lieutenant, H.

This table is chiefly interesting as showing the gradual diminution in the price of corn from the days of the Peishwas to our own. By comparing the prices at the commencement with those end of the table, and then reading the list over, this circum-

by the people as a year of scarcity. Corn, though doubly and the then as in the preceding and succeeding years, did not fetch the ordinary prices in 1218, 19, 20, 21 as inserted in the commencement of the table—a forcible example of the change in the relative value of money and produce which had occurred in the intervening 20 years. The extraordinary and sudden fluctuations in the price of corn are also remarkable in 1227; we find it twice as dear as in the preceding year 1226, and in 1228 it is nearly three times as dear as in 1226. In the year of famine (1234) we find it seven times dearer than in the plentiful year 1238, and in Fusice 1242 the price of grain is three times higher than in the preceding year 1241.

The Indapoor measured seer is larger than the Poona; the latter is, I believe, more than double the size of that of Bontise.

N.B.—But little bajree is generally grown in the pergunna. Jowaree is the principal food of the inhabitants; its price therefore has alone been considered in making use of this table.

Dhelee land, or land on which a sediment is left by the over-flowing waters of the rivers, has been assessed somewhat more highly than any description of land mentioned in the table, but there is very little land of this description in the pergunna; and land merely wetted in the rains by the overflowing of rivers, called by the natives Mullace, has been also rather more highly assessed than it would have been by the accompanying rates. Of this description also there is very little land in the pergunna.

TABLE No. V.

TABLE of RATES of ASSESSMENT per Acre on the within-mentioned kinds of Soil.

	lst Black	2nd d Black	31d Black	1st Red	2nd Red	3rd Red	let Burrud	2nd Burrud	3rd Burrud.

In Annas	12	9 7	6 10	8	5 2	3	1	2 5	1 5

It was first intended to have entered in this table the various assessments of all the Government villages in the pergunna, of which there are 76. Doing so would, however, have much increased the bulk of a report which already exceeds the size to which I could wish to restrict it, and would not, I think, enable any passon to form a better judgment of the merits of the present system than can be made from what has already been stated on the subject.

## TABLE No. VI.

COMPARATIVE STATEMENT of the Tunka, Kumal, Paimash, and Prutburdy Assessments of a few of the principal Villages in the Indupoor Pergunna and of the Pergunna itself.

## Appendix No. II.

No. 139 of 1838.

To R. MILLS, Esq.,

Principal Collector, Poona.

Sin,—In transmitting the accompanying copies of correspondence from Lieutenant Nash upon the completion of the revision of assessment of the Indapoor district, I beg to apologise

for the length of time suffered to elapse before doing so, which has been partly occasioned by the little leisure left me during the fair season, and also by my wish to learn the results of the past year's settlement before closing the present report.

- 2. Lieutenant Nash designedly omits giving any details connected with the plans pursued for revising and correcting the survey measurements, classifying the lands, and superintending the native establishment, in consequence of memoranda upon these points having previously been furnished you by Mr. Goldsmid and myself, and confine himself to an investigation of the principles on which the revision has been conducted, its results as compared with Mr. Pringle's, and the Mamool settlements of the district, and its effects on the condition of the people and the revenues of Government.
- 3. Mr. Goldsmid was vested with most ample discretionary

  power \* regarding the conduct of the revision of assessment, and the plan he adopted for procuring the requisite data was to revise and correct the survey measurements, and to make an entirely new classification of the soil.
- 4. The accuracy of the measurement was tested by having a certain number of the fields of every village (marked off from the papers, by the European officers) re-measured by the carkoons of the establishment, whose work was subsequently tested by the surveying officer, and accuracy ensured by the prompt infliction of punishment upon occasion of error or negligence on their part being brought to light. If the result of this investigation showed the survey measurements to have been executed with a tolerable degree of accuracy,† they were retained and corrected when
- mecessary; but when it appeared that the truth.

  \* Within 10 per cent. of the errors were beyond reasonable limits and likely to vitiate the assessment, the village was wholly re-measured. The necessity of making an entirely new classification of the soil, without reference to that executed at the time of the survey, was owing to the latter being

made after no general standard, the particular classes of soil in one village (as described in the 77th paragraph of Lieutenant Short-rede's report) not corresponding with those bearing the same denomination in another, which must have increased greatly the difficulty of forming an effective check, if it did not render this altogether impracticable.

- In consequence of this defect in the survey classification Mr. Goldsmid determined to reject it altogether and re-classify the whole pergunna upon one general system, having reference solely to the natural productive qualities of the soil, and leaving wholly out of consideration extrinsic circumstances, such as vicinity to Me village, command of water, &c. &c., which, although carefully noted, with the view of finally assisting in fixing the assessment, were not permitted to affect the classification. By this means me elements of the classification were reduced to a consideration of the natural fertility, of the soil alone, which rendered the work comparatively simple, and enabled the European officer, after acquiring some practical knowledge of the different descriptions of soil usually met with, to become an effective check upon the carkoons engaged in classifying the land. Such is a brief sketch of the preliminary measures pursued in Indapoor with the view of obtaining data for the assessment, for more detailed information regarding which than could conveniently be embodied in the present letter I beg to refer you to my memorandum on the subject, dated 15th April 1837. I now resume the consideration of Mr. Nash's report.
- of In his 3rd paragraph he mentions that of 86 villages comprising the pergunas, 17 have required to be wholly re-measured. In nine of these 17 villages he attributes the errors of the survey measurements to design, while in the remaining eight he thinks the discrepancy between them and the present measurement of bount daries due to the fancy of the cultivator. However this may be, the fact of the survey measurements having been found so generated correct is extremely, satisfactory, and my own experience them and lead me to infer that they were in general executed with

much greater fidelity than is usually considered to have been the case.

- After briefly noticing the different instructions issued by Government respecting the revision of assessment, Mr. Nash in the 5th and 6th paragraphs of his report proceeds to consider the reasons which induced Mr Goldsmid to adopt a greater number of rates than had originally been contemplated as necessary. \* On the substitution of the invariable acre," he observes, "for this pliable and accommodating measure" (the Chahoor, which commonly varies in size according to the quality of the land), "a close examination into the nature of the soils in the pergunna and their comparative productive powers showed that minuteness of valuation could now only be obtained by the introduction of a greater number of rates." The objects indeed of accurate measurement and minute classification, which are to ascertain the relative values of different fields, would be lost sight of by any considerable limitation of rates, on which account it was determined that in Indapoor they should be limited only by the extreme of assessment fixed for the worst and best description of land, or range, according to the quality of the soil, from 2 annas up to 12 annas per acre of Jerayet land.
- 8. The 7th and 8th paragraphs of Mr. Nash's report will be perused with interest, as containing a clear and satisfactory exposition of the main causes of inferior land being relatively higher assessed at the survey than that of better quality. He shows this to have been the inevitable result of the principle adopted at the survey, of assessing the land at a percentage of the net produce. "This," he justly observes, "was in fact remunerating the oultir' vator, not according to his labour, but in proportion to the value of the field on which he laboured." From a calculation made from the survey papers of 15 villages he shows, in a tabular form; the amount of profit which, according to Mr. Pringle's assessment; would be received from cultivating a portion of the various classes of soils requiring each an annual outlay of 5 rupces. This, it will be seen from his table, diminishes gradually as the quality of

the soil becomes inferior, till at length it is nearly absorbed in the Government assessment, which then renders cultivation next to impossible. When the cultivation of 1st Black soil, as will appear from an inspection of Lieutenant Nash's table, receives a return of upwards of 50 per cent. upon his outlay, and that of 3rd Burrad only about 81, we need search no further for a satisfactory reason for the survey assessment pressing heavily upon inferior lands. If a coonbee, at an expense of 50 Rupees, can obtain from good land 100 Rupees' worth of produce, and from inferior land at the same expense can only obtain 80 Rupces' worth, the net produce in one case is worth 50 Rupees and in the other 30; and if a half of this were the proportion to be taken for the Government assessment, the e would remain to the cultivator a profit of 25 Rupees. in the one case and 15 Rupees in the other; but surely where the labour, the stock, and the outlay required are equal, so ought also to be the profit.

9. To afford a further illustration of the effect of these principles upon the survey assessment, I have compiled the following table from the papers of the village of Ooplay Boodrook in the Marha Talooka, in which the assessment was fixed at 55 per cent. of the net produce, as estimated by Mr. Pringle's assessors. Column No. 1 of the table gives the number of acres of each description of soil, which, according to their calculations, can be cultivated at an annual expense of 100 Rupees; column No. 2 the net produce per acre, and No. 3, 55 per cent. of this, or the rate of assessment; No. 4, the amount of assessment upon the number of acres entered in column No. 1, and No. 5 the balance of net produce, or profit, remaining to the cultivator. By inspecting the last mentioned column it will be found that from 1st Black to 3rd Burrud the profits of cultivation vary from Rs. 32-8-3 to Rs. 12-5-3, the expenses in every case being 100 Rupees. The total amount of assessment upon the number of acres entered in column No. 1 of the table is Rs. 236-7-3, and the three last columns are entered to show how, under the supposition of this remaining the. me, the rates should, in my opinion, have been adjusted, to leave, The profits of cultivation in all cases exactly equal.

- 10. There are, however, other sources of error in the survey assessment to which, with that already mentioned, must be attributed its failure more than to any defects of execution. The chief of these consist in it being founded on an average of the prices of grain, and the amount of collections during previous years, without a due consideration being given to the actual condition of the people, and to an investigation of the causes which during the years of the average had made these prices and collections stationary or fluctuating, advancing or declining. To adopt as a basis of assessment an average of past collections was to admit that the previous settlement was not heavy as a whole, but merely required being properly apportioned, which the yearly increasing poverty and wretchedness of the people, a declining cultivation, and a progressive fall in the price of grain, notwithstanding a diminished supply, all tended to disprove. The calculations too for fixing the survey assessment were made upon the supposition of the land being properly tilled, whereas there is perhaps not one field in ten in this collectorate that is so, or that commonly yields the quantity of produce estimated in the survey returns. These circumstances contributed to make the survey assessment high, while fixing it at a percentage of the net produce made it unequal; and to them may be attributed its failure, rather than to the venality of the native establishments employed in carrying it into execution. These may have been bribed in numerous instances to effect a reduction of the rates, but this would have tended to secure the success, rather than involve the failure of an assessment; and that they should systematically over-assess inferior and uncultivated lands without the prospect of gain, and at the risk of detection, appears to me very improbable. I have dwelt at this length upon the survey assessment at the risk of being thought tedious on a question not immediately bearing upon my subject, that by exposing the sources of error which, in my opinion, occasioned its failure, my superiors may be better able to form a correct estimate of the principles on which the present revision has been conducted.
  - 11. In his 9th, 10th, and 11th paragraphs Lieutenant Nassa

gives an account of the manner in which the revised rates were obtained, after which he proceeds to consider the new assessment with reference to the Survey, Kumal, and Tunka settlements. The Tunka assessment of the pergunna, as it appears from his 12th paragraph, amounted in round numbers to Rs. 1.22,000, the Kumal to Rs. 2,28,000, the Survey to Rs. 2,03,000, and the present revised assessment to Rs. 84,000. The last will doubtless appear a startling reduction, but it will afterwards be shown that it is so upon paper merely; and it must be recollected that the district never prospered but under the Tunka settlement, that the Kumal could not be realized during even the height of the Maratha prosperity; and that the collection of the Survey assessment was obliged to be suspended almost immediately subsequent to its introduction. The continued fall in the prices of corn which has taken place of late years, and the little prospect of any improve ment in this respect, imperatively calls for a great reduction of former rates: and Lieutenant Nash shows clearly that the present assessment, low as it is, yet, considered as a commutation for a corn rent, is but inferior to the Kumal itself. "The Kumal assessment of 2,28,000 Rupees is a commutation," he says, "for 5,472,000 seers of grain, at 24 seers per rupee, and this rate is not a high one for that time, as tables Nos. 1 and 4 will prove;" while the present assessment of 84,000 Rupees is a commutation for 452,000 seers at the rate of the average price of corn here for the last five years, viz. 53 seers for one rupee.

12. Lieutenant Nash then proceeds to show that, notwithstanding the apparent lightness of the present assessment, Government has already been a gainer thereby to a very considerable extent. From his 17th paragraph, and table therein referred to, it appears that from Fuslee 1235 to 1245, excluding 1242, a year of scarcity, the average collections on account of current year's revenue amounted to Rs. 32,802, and that Rs. 48,020 is the largest sum collected on account of current revenue in any of the fourteen years preceding Tuslee 1246, when the revised assessment was partially introduced the remissions on account of failure of crops were Rs. 4,378-14-6, the net revenue Rs. 51,389-1-0, of which

Rs. 50,198 were collected during the official year and in Fusice 1247 when the revised assessment was first brought into general operation, and notwithstanding a rather unfavourable season, the remissions on account of failure of crops fell to Rs. 2,401 2-2, the net revenue was Rs. 52,391-0-4, of which Rs. 52,234-5-2 were collected before the termination of the official year. Such are the immediate results of the present settlement, and they must be admitted to be most satisfactory as far as the interests of Government are concerned, and to afford a cheering proof that these are inseparably connected with, and dependent upon, those of the people.

- 13. Although the preceding observations, with numerous other arguments adduced in Lieutenant Nash's report, may be deemed to afford sufficiently convincing proofs that the present settlement is not too light, yet believing in the paramount importance, the absolute necessity of imposing, in the present depressed and impoverished state of the Deccan, the most moderate assessment at all consistent with the conservation of the finances of the State, I trust to be excused in devoting a few additional observations to this part of my subject.
- Government its condition was comparatively flourishing, and its present lamentable state of poverty I ascribe chiefly to the circumstance of an onerous land tax having been retained after the precious metals had greatly increased in value, owing, as happily described by Lieutenant Nash, to "the ebb from Maharashtra of the wealth and riches which the tide of fortunate plunder had brought in." Had this inevitable consequence been foreseen, and the land tax timely reduced to meet the altered circumstances of the country, twenty years of peace and security could not have resulted in general poverty and wretchedness, but on the contrary would have found the now half-deserted villages of the Deccan filled with a thriving and contented peasantry amid a constant fluctuation in the value of the precious metals.
  - 15. The value of corn necessarily renders a fixed money assessment one of a most variable nature. In a very few years

subsequent to its imposition an increase in the value of money may make that onerous which was originally light, and therefore in making a settlement intended to be permanent, this imposes the necessity of doing so with reference to the price corn may fall to, rather than to an average price, or that to which it may probably rise to. The data too procurable for fixing an assessment must be considered only as rough approximations to the truth, instead of being absolutely correct, and we must not therefore be implicitly guided by them, but making every allowance for errors, fix our assessment sufficiently low to secure its remaining unaffected by their occurrence. Such are a few of the considerations urging the policy of a low assessment; there are others connected with the improvement of the land and the condition of the agricultural population which I shall now proceed to touch upon in treating of the term for which the present settlement should be declared permanens.

- 16. Government has already determined that the present settlement should last for ten years; but I would respectfully submit that this is much too limited a term to admit of the resources of the people being greatly increased, or to hold out much inducement to undertake permanent improvements involving any considerable outlay of capital. It would tend indeed to retard rather than advance such objects, by creating a distrust of our intentions. at the expiration of the term, an apprehension of the assessment being then raised in proportion as the land had increased in value, which would effectually prevent any expensive improvements. Besides a better system of tillage, which may be hoped for from a moderate assessment, the most general improvements likely to be undertaken are the construction of wells and bunds with the view of converting Jerayet into Bagayet land, both of which, however, require in general an expenditure of capital which it would require many years to repay.
- 17. The most certain way of giving an impulse to agricultural industry, and attracting capital to the improvement of land, would be to create a private property in the latter by declaring the present settlement to be permanent; but should Government

be averse to compromising its claims to such an extent, I would strongly advocate the policy of extending the present term to a period of at least thirty years, which would afford time for the renovation of the dilapidated resources of the country, and hold out to the cultivator a fair prospect of obtaining an adequate remuneration for any outlay he may feel inclined to make in the improvement of his estate. Such a term would secure many of the advantages of a permanent settlement, and by rendering land saleable tend to bring it into the possession of people of capital, and thus check, in some measure, the continued subdivision of property arising from the laws of inheritance, which threaten to retain for ever the cultivating classes in the condition of mere labourers, and to prevent the accumulation of wealth, with its attendant advantages of an extension of commerce and manufactures.

- 18. The 23rd and following paragraphs of Lieutenant Nash's report contain an account of his proceedings in carrying into effect the instructions of Government to impose an additional tax upon all Bagayet lands watered from wells. There is very little "Kuddum" Bagayet (irrigated land which paid an additional tax under the Mamool settlement) in the Indapoor Pergunna, and the imposition of the present rates may on this account be viewed with some little dissatisfaction at the outset; but they are so low that I think it impossible they can interfere with the extension of Bagayet cultivation, or afford any real ground of discontent. From the circumstance of their not having yet been brought into full operation, however, we do not possess the requisite experience to enable us to pronounce with certainty upon their merits.
- 19. Before concluding this Report I shall venture to add a few observations regarding revenue management, upon which must in a great degree depend the successful introduction and stability of any assessment. The moderation of the present rates has hitherto greatly encouraged, and, it is hoped, will not hereafter present any obstacle to, an extension of cultivation; upon this account I conceive no cowls should be given for the purpose of breaking up waste lands, except in very particular instances, where the outlay required is unusually great. The quantity of land

now under cultivation in Indapoor is much too greatfor the means of the cultivators, and this circumstance must tend to retard their advancement. For the same reasons I am of opinion that no efforts are required on the part of the Collector's establishment to induce the ryots to extend their cultivation, or to deter them from relinquishing what they now hold. A cultivator must be much better able to judge than the Government authorities of the proper time to extend or contract his agricultural operations, and the slightest interference with his freedom of choice in this respect will be injurious to his interests. Such a system of interference in the Sub-Collectorate of Sholapoor, and, I fear, throughout the Deccan, has been productive of incalculable evils, and perhaps as much as the weight of the assessment itself has contributed to reduce the cultivators to their present state of poverty and wretcheduess, and to occasion the slovenly inefficient system of tillage now prevailing.

- I am not here bringing forward a theory, but simply stating facts coming under my own observation, and which are the necessary consequences of the system pursued for forcing cul-The district and village authorities, with the view of obtaining a character for diligence and efficiency, and exhibiting a nominally large rent-roll, have been accustomed to use every expedient, whether of persuasion or intimidation, to prevent land" being thrown out of cultivation, and this with little or no regard being had to the means of the cultivator, who upon sustaining any reverse, such as a mortality among his cattle, instead of being permitted to contract his concerns to meet his diminished resources, has been obliged to retain the same quantity of land under cultivation, and continue to pay the same revenue when no longer able to raise the same quantity of produce. These measures, which were followed of course by a call for large annual remissions, obliged those subjected to their operation to resort to a wretched system of cultivation, and generally ended in ruining them altogether.
- 21. I wish I could persuade myself that the representation here given is at all overdrawn, but I am unable, and would,

therefore beg to press upon your consideration that in such a state of things no assessment, however moderate and just, can have a fair trial. To cultivate properly any quantity of land requires a certain number of cattle, agricultural implements, &c., and any attempt to increase the former without adding to the latter must necessarily fail; and the undertaker would find that while obliged to pay an additional assessment on account of his new land, the produce of that and his old taken together would not amount to what he had been in the habit of receiving from the latter alone. Any interference, then, on the part of Government officers, which induces a ryot to take up more land than he has the eans of properly cultivating, operates exactly in the same way as if the assessment of his original holding had been increased by the whole amount of revenue receivable from the land so taken up.

- 22. There is another point of importance to the stability of the present settlement, and that is the preservation of the boundaries of fields as now laid down. The recessity of such care was strongly urged by Mr. Pringle upon the completion of the survey of this collectorate; but the measures adopted in consequence have failed in effecting the ends in view, and it has been found that, after the lapse of 10 years only, a very large proportion of the boundaries of fields laid down at the survey has been changed or wholly obliterated. Your late orders respecting the annual inspection of every field in the pergunna, and the preparation of "numberwar keerds" for each village, if rigidly acted upon, will do much to effect a remedy; but in addition to this I would suggest that the Kumavisdar and his carkoons be directed to take particular notice of every infringement of a boundary for which the owner of the field should be summarily punished. The imposition of a slight fine would probably be found sufficient, and a little vigilance on the part of the district establishments during the ploughing seasons, when such encroachments are usually effected, would do much'to put a stop to the practice.
- 23. The adoption of the foregoing suggestions would, in my humble opinion, be of great service towards ensuring the success of the present settlement, which even now, it is pleasing to state,

Lieutenant Nash in his 22nd paragraph, "the cheerful and contented looks of the peasantry, and the marked improvement in their dress, bear witness to this," while the return of many of the old Meerasdars, the eagerness displayed in contesting the possession of land, and the rapidity with which every description is being brought under cultivation, afford satisfactory evidence upon the same point. If Providence favour us for a few years with a succession of tolerable seasons, a marked change for the better in the condition of the people, the agriculture, trade, and manufactures of the districts may confidently be anticipated.

24. Instead of confining my observations to the pergunna of Indapoor alone, you will have observed that they are frequently applicable to the general question of a revision of assessment throughout this collectorate, which has been done through my anxiety on the eve of enlarging the sphere of our present operations, to place before Government the fullest means of judging of the value of the principles by which our measures are to be conducted, to afford opportunity for receiving further information regarding points left unexplained or obscure, and time to point out and correct whatever in the system is erroneous in principle and defective in operation.

I have the honour to be, &c.

G. WINGATE,
Superintendent Revenue Survey.

Poona, 31st July 1839.

P.S.—While penning the preceding report, my acquaintance with the principles upon which the survey assessment was conducted was confined to the information contained in the Maratha records of the undertaking, and the incidental notices regarding it, scattered through the different correspondence connected with the revision of that assessment. Subsequently, however, I have been furnished by Mr. Secretary Reid with Mr. Pringle's able and perspicuous report of the 6th September 1828, addressed to

- Mr. Chief Secretary Bax, and which contains a full exposition of the principles by which Mr. Pfingle's assessment was conducted, and displays the deep research and minute investigation which were devoted to the consideration of all the grounds on which such principles can alone be securely based.
- 2. I cannot here refrain from expressing my regret that I was not earlier placed in possession of documents displaying so fully the enlightened and scientific basis of the assessment upon which it was become my duty to comment, and that the anxiety of Government to obtain Mr. Nash's and my own reports upon the completion of the settlement of the Indapoor Pergunna will preclude the possibility of our availing ourselves of the knowledge we now possess, by adding to our observations, so as to remove from them any appearance of a want of consideration in our remarks upon past operations, and of inattention to the principles by which they were conducted.
  - 3. Mr. Nash and myself attribute in our reports the failure of the survey assessment to the circumstance of its having been fixed with reference to the "net produce" instead of the "rent of land." In reading with attention Mr. Pringle's report it is impossible to resist the impression, that these two terms have been considered synonymous, and that while he calculated his assessment on what is strictly the "net produce," that what is left to a tenant after defraying all expenses of cultivation, he spoke of its operation as though it had in reality been based upon the "rent," or what that tenant could afford, suitably providing for himself, to pay from that sum to his landlord.
  - 4. "Net produce," says Mr. Pringle in the 11th paragraph of his report already quoted, "is that portion of the whole money value of the average gross produce estimated at an average price which remains after deducting all outgoings on account of labour and capital, each item of these being calculated at its ordinary and average rate." And strictly in conformity with this sketch, of which the details are given in his 19th paragraph, were the expanses of cultivation of every description of soil calculated by the

survey assessment; and it may here be remarked as an important? fact, which I shall presently allude to, that their calculations ex; hibit in all instances, and for every variety of soil, a considerable portion of the gross produce remaining after all expenses of cultivation have been deducted, which is termed, and termed justly, "net produce."

That Mr. Pringle, however, conceived this to be "rent" appears clearly from his 39th and 40th paragraphs, wherein he states it to be "the general tendency of his assessment to place all lands exactly in the same relative position which they would naturally hold if no assessment existed at all; that is to enable them to yield a rent to the owner, progressively increasing in amount from the worst to the best soils according to their quality." "if the whole of the net produce were exacted, the productive energies of the country would be greater than they could be under any mode of raising the same amount of taxation, but property in the soil would be annihilated." Such observations, however, can only possibly be true of "eent," which, as stated by the Right Honourable the Governor in Council in a letter to the Revenue Commissioner, dated 4th May 1838, No. 1698, is "greatest on the

\* Including the farmer's profit,

+ Net produce.

until we come to the very worst, where the cost\* of cultivation absorbs the whole surplus † and no rent is paid at all;" while produce," as defined and practically estimated by Mr. Pringle, and in the common acceptation of political economists, is the surplus remaining after all outgoings on account of labour and capital have been paid, the fund from which the tenant must be supported and the landlord receive his rent. It is greatest on the best, and decreases in amount from that to the worst description of soil in cultivation, where it still exists, although merely sufficient to induce the farmer to cultivate such land, and being merely so, can afford no rent to the landlord. And therefore the part alluded to in the 4th paragraph of this P.S. of Mr. Pringle's cultivation, giving a considerable surplus produce for the very worst description of soils, shows that his assessment was founded on a percentage of the "net produce," and not of the "rent."

most fertile land and decreases on worse soils,

6. Any assessment therefore forming so large a percentage (55 maunds) of the net produce as Mr. Pringle's must, by absorbing the whole of the rent of inferior soils and retrenching upon the farmer's profits, throw such soils out of cultivation, until the price of grain is so raised by the demand as to permit them to be cultivated with advantage; and in this case the Government assessment, by raising the price of grain generally, would take much more from the pockets of the people than it would bring into the coffers of the State.

G. WINGATE,

Superintendent Revenue Survey.

Poona, 4th August 1838.

## Appendix No. III.

• No. 2683 of 1839.

TERRIFORIAL DEPARTMENT, REVENUE.

To the REVENUL COMMISSIONER.

Sir,—I have the honour to hand up an original letter, No. 139, dated 4th ultimo, from Lieutenant Wingate, and of its enclosure from Lieutenant Nash, being that officer's report on the survey and assessment of the Indapoor Pergunna.

- 2. I shall merely trouble you and the Government with a few general observations on the measures which have been adopted, and on the suggestions which have been offered by Messrs. Wingate and Nash, those officers in their respective reports having fully explained every particular connected with the operations they have been conducting.
- 3. The Government letter of the 7th September 1835, 2056, discussed the several points on which the survey and this sessment of this pergunna was to be based, and conveyed certain instructions for the guidance of the surveying officer. The Government will observe that neither Lieutenant Wingate nor

Lieutenant Nash give any details connected with the plans pursued for correcting the measurement, classifying the land, &c., in consequence of a memorandum furnished to me privately at my request, and I consider it a private document. Yet, as Lieutenant Wingate alludes to it, I presume he considers it official (5th paragraph); and as it may be serviceable to Government in elucidating many points noticed in this correspondence, I have deemed it my duty to submit a copy of it with this report.

- 4. The measurement of the different fields in a village seems to have been carried on in a manner likely to ensure accuracy. It appears, however, that the survey measurements were executed with much greater fidelity than was usually considered to be the case,\*
- \* 6th paragraph of Lieut. Wingate's report.

  and therefore there was much less labour to be performed than might from previous reports have been anticipated.
- 5. With respect to the classification of the soils, one uniform standard was adopted, having reference solely to the natural fertility of the soil, leaving wholly out of consideration extrinsic circumstances, such as vicinity to the village, command of water, &c.

  The adoption of one general standard, under all the circumstances stated, seems a judicious' measure, particularly as no practical bad effects appear to have resulted from it, whilst it must greatly have tended to simplify the subsequent arrangements.
- 6. As Government (17th para.) left it to the discretion of the settling officers to fix the number of rates, Mr. Goldsmid, for reasons recorded, determined to have nine rates—the highest 12 annas per acre, and the lowest 2 annas per acre. Both the maximum and minimum rates of assessment are extremely low when compared with the Mamool and survey rates previously in operation, but as they have been fixed after minute inquiries, and in consideration of local peculiarities and the depressed condition of the ryots, it is possible they are as high as they ought to be under existing circumstances; for, as I stated in my report (18th para.) the rent to be paid per acre can be alone determined by the

judgment and experience of the settling officer, and the best means with the data at command for accertaining the proper assessment the land should pay seems to have been adopted.

- 7. It must be recollected that the present state of the Indapoor Pergunna is to a certain extent fictitious. Advantageous leases and a low assessment have attracted a number of ryots from neighbouring states and from our own highly assessed districts. It remains to be seen at a future period, when the assessment in the districts bordering on Indapoor has been modified and reduced, whether the fugitive ryots will return to their paternal fields, and leave the district singularly unfortunate as regards the periodical rains, and to which they have been attracted by low rates and other advantages which they do not possess by cultivating their hereditary fields.
- 8. I have attentively considered the interesting remarks and observations in Lieutenants Wingate's and Nash's reports on the mode adopted by Mr. Pringle of assessing the land according to a percentage of the net produce.
- 9. Lieutenant Nash appears (7th and 8th paras.) to have clearly shown that the principle adopted of taking 55 per cent. of the net produce was erroneous, and was the chief cause of the inferior soils being more highly assessed than the better description of land. In the present assessment this error has been corrected, and each description of land is now assessed according to its relative value with respect to the value fixed for the first description of land, and the principle appears to be just.
  - 10. In the 33rd paragraph of Lieutenant Nash's and 18th of Lieutenant Wingate's reports they allude to the assessment on Bagayet land. On this subject I beg leave to refer Government

No. 898, dated 18th July 1835, para. 24; No. 79, dated 26th January 1836. to the observations contained in my letters to your address, as per margin. To tax Bagayet land is, in my humble judgment, impolitic, and seems to be directly at variance with the

Hommrable Court's orders, that land should be assessed according to its produce; but as the assessment has been fixed in obedience

to orders, it only now remains that the error be corrected as soon as possible before its evil consequences will be felt in checking Bagayet cultivation and throwing wells out of use.

- 11. The only remaining subject I shall now treat upon is the extension of the period for which the present assessment is to continue from 10 to 30 years. Lieutenants Wingate and Nash have offered some sensible observations on this subject; but the very arguments which those officers use in favour of the extension are, in my judgment, conclusive of the policy of limiting the period to 10 years, for which Government have already engaged that the present leases shall continue.
- Lieutenants Wingate and Nash both allude to the fluctuation in the price of the precious metals as one of the principal causes which must always affect in money assessment, the vast increase of cultivation; and the prospective increase which may be anticipated in a few years, when the whole Deccan is more accurately surveyed and more equally assessed, must contribute so to raise the price of money by augmenting the quantity of produce greatly beyond the demand for it, that even the assessment of Indapoor, low as it is, may in a few years be considered too high for the cultivators to pay. Lieutenant Nash observes (22nd para.), "the price of grain is constantly fluctuating, and with it the value of the crops and the money rent of the land," and under such circumstances "a money assessment which is one year paid with ease will, if exacted from the people in the next, take from them a part of their fair portion of the produce of the earth" (22nd para.). And Lieutenant Wingate, in speaking of money assessment, observes (15th para.), "an increase in the value of the precious metals may make that onerous which was originally light." Now, as the rent to Government is paid in money, it seems for these very reasons impolitic that Government should, as far as its own interests are concerned, as well as for the interests of the ryots, pledge itself to any longer term of years for the continuation of the present settlement. It must always be borne in mind that Government must always be losers, and can never be gainers. If the value of money diminishes, or, in other words, the produce

of the soil, from whatever cause, is dear, Government cannot raise the assessment to meet the loss they will sustain; whereas if money rises in value, or, in other words, the produce of the soil is very cheap, good policy and humanity necessarily oblige it to reduce the assessment, or the land will be thrown out of cultivation, and the ryot's circumstances so much altered that if he continue to pay the assessment he must be ruined. Though in all probability for the next 10 years there will be no alteration in the state of the country of such importance as materially to affect the present settlement, which is only to last for ten years, yet every thinking man is fully aware that within thirty years—the period during which Lieutenant Wingate wishes the assessment to last—a great alteration will take place in the moral condition of the people and the political state of the country, and I can see no good or substantial reasons for Government pledging themselves for so long a period. \* ·

13.° It must be borne in mind, as I before observed (7th para.), that the present prosperous state of the Indapoor district is the result of low rates of assessment and advantageous leases, and not of an increased demand for the produce of soil. therefore justly be considered fictitious, and its continued prosperity and flourishing state to rest in a great degree on the continuance of the present state of the districts which surround or are contiguous to it. The moment the assessment in those districts is reduced, so that a fair profit will be left to the cultivator, we shall in all probability find that the cultivation in Indapoor will decline. Lieutenant Wingate even now observes (19th para.) "that the quantity of land now under cultivation in Indapoor is much too great for the means of the cultivators, and retards their advancement." It must also be recollected, as well observed by the Revenue Commissioner, that the supply of rain is singularly precarious in the districts; and should any season of drought occur, it is fair to presume that the ryots, who are not permanent occupants of the soil, or Meerasdars, will return to their parternal fields, which they may only have left in consequence of over-assessment, and which may be situated in districts where the periodical rains

are less precarious, and where a reduction in the rates of assessment may offer them exactly the same advantages they enjoy by cultivating land in the Indapoor district.

- 14. From the remission of the transit duties and other númerous taxes which have hitherto fettered the energies of the people, and from the progressive improvement of the country by the construction of roads, and, above all, the moral improvement of the people by education, &c., Government have every reason to anticipate that the utmost activity, both in agriculture and commerce, will in the course of a few years prevail. How far and to what extent these consequences may affect the land assessment it is impossible to say, but that they must affect it there can be no doubt, and Government should therefore in no degreee pledge themselves to any system or measure so liable to fluctuate as the land assessment beyond that period necessary to give encouragement to agriculture in a district like that of Indapoor.
- 15. For all these reasons I strongly dissent from the proposition to extend the present lease to thirty years.
- 16. I quite concur in the observations in Lieutenant Wingate's 19th para. if, as I understand them to apply to the Indapoor district in its present state, no Cowl under such a low assessment as has been fixed should be granted, except in very extraordinary cases, when a large capital is embarked in any scheme or improvement. When the other districts of the collectorate have had their land assessment modified, a similar course should be adopted.
- 17. The subdivision of property alluded to by Lieutenants Wingate and Nash, and the practice of marrying early, are no doubt evils of great magnitude, and have in all probability tended to retard, as they must tend to retard, the advancement of the natives to opulence. The tendency of these religious or civil institutions is to prevent the rise of a class of wealthy individuals whose capital might be advantageously disposed of in improving their agriculture or in increasing their merchandize. The immediate descendants of the fortunate possessors of wealth dwindle down to that scale from which their ancestor may have emerged by his

industry or ability, and the wealth which he acquired becomes so subdivided amongst his descendants that it enables the possessor to do little good with it, and adds but little. As these evils are they cannot be, and must not be, interfered with. It must be left to education to improve the moral condition of the people, and they will themselves then see the good and sound policy of not marrying their children at so early an age as they now do, and of deviating from the principle they now observe of subdividing their property amongst their children; for, as justly observed by Lieutenant Nash, "education appears to me to be as much the means of giving security and increase to the Government revenue as of improving the moral and mental condition of its unenlightened and unfortunate but teachable subjects."

18. I beg to forward a statement of all expenses incurred in surveying and assessing the Indapoor Talooka, as called for in the 2nd para. of a letter from Government to my address, No. 3309, dated the 3rd instant.

I have the honour to be, &c.

R. MILLS,

Principal Collector.

Principal Collector's Office, Poona, 20th September 1838.

## Appendix No. IV.

No. 2297 of 1838.

TERRITORIAL DIVISION, REVENUE.

To L. R. REID, Esq.,

Acting Chief Secretary, Bombay.

Sir,—In reference to the latter part of the 21st para. of your letter (No 1489), dated 19th April last, I have the honour to submit a report from Lieutenant Nash on the mode in which the survey and revision of the assessment has been conducted in the Indapoor

Talooka, the only district of the Deccan in which those operations have been completed.

- 2. The new settlement has been the basis of the revenue settlement for the last two years; and what makes this report particularly interesting, and, I may add, satisfactory, is the evidence it contains of the success of the important settlement which is the subject of it.
- 3. The survey and assessment as regards Indapoor may be briefly described as follows:—
- 1st.—The survey measurements in acres have been carefully tested, or, where any considerable error has been discovered, the land has been re-measured.
- 2nd.—A new classification has been made of the land according to its soil, situation, and other capabilities for cultivation, and every field has been entered under one or other of the nine classes.
- 3rd.—The boundaries of those fields where they had previously been lost have been ascertained and marked afresh.
- 4th.—A complete land register has been framed in which the name, number, position, boundaries, tenure, extent, class, distance from the village, and all other particulars relating to the fields have been carefully entered.
- 5th.—An assessment has been fixed on the land according to its class and capabilities.
- 6th.—The land has been let out on 10 years' leaser at the assessment so fixed, each man's holding and the assessment he has to pay being so described in the lease as to leave little room for defrauding either him or Government.
- 7th.—The whole work has been conducted on a system of such strict checks and supervision as to guard, as far as possible, against errors arising either from carelessness or fraud.
- 4. It now remains to be seen what effects have been produced by these improvements, as they must be acknowledged to be, when it is considered that, previous to the commencement of this work,

neither the measurements, boundaries, nor classifications, as entered in the records, could be depended on as correct; that the assessment was so heavy that little more than one third of the arable land had been cultivated for the last 10 years; and that though in that period remissions were given in all but one season, and they four times in 12 years exceeded the amount left to be collected as Government revenue, yet the latter was collected with so much difficulty that heavy balances were left unrealized at the end of the year, and the district generally was reduced to the extreme of poverty; and that the effect of the heavy assessment and all this uncertainty regarding it, was to give rise to a system of oppression and fraud to which the records of Government afford few parallels.

5. It should be premised that the nominal rental or assessment of the whole pergunna was by the—

Tuenka	Rs.	1,02,548
Kumal		
Survey	,,	2,02,674
Present assessment	,,	83,818

- 6. The effects of the revision of the assessment as seen in the last year (which was, be it remembered, not better than an average one) were—
- Tst.—Since the revision commenced, cultivation has increased to an extent very far beyond what it has been for the last 12 years; and though it is difficult to compare the present acres with the vague beegas in which the land was registered previous to 1238 (1827-28), yet the quantity of land now under cultivation is as much, if not more, than when we first got possession of the pergunna, which was then more prosperous and cultivation more extensive than it has been before or since.
- 2nd.—As the nominal rental has been so much reduced, it is to be expected that the gross Jummabundy would be so also; nevertheless it was higher than in seven of the 19 years preceding.
- 3rd.—After deducting bucks and remissions, the net revenue to be collected on account of Government is higher than it was in nine, and lower than it was in ten of the preceding years.

- 4th.—The sum actually collected and paid into the Government Treasury in the course of the year—the chief point to look to in the question of mere pecuniary profit and loss to Government—has never been so great except during the first four years of our occupation, when it is generally acknowledged our demands were much too high.
- 5th.—The outstanding balances have never yet been so low at the end of the official year as they were last year.
- 7. In short, at an expense (every item included) of Rupees 12,165-14-1, or about one-third less than the average of the balances outstanding at the end of the year during the first 17 years of our possessing the country, a light and equitable assessment, paid punctually, and without difficulty by a contented and grateful body of ryots has been substituted for a heavy nominal paper assessment, never realized to its full amount, and yielding less actual cash to the Government coffers, and even that exacted from a population which was yearly sinking towards ruin.
- That neither this picture nor the description given by Messrs. Wingate and Nash in the present reports, or by Messrs. Goldsmid and Mansfield in their two last annual reports, on the state of the district are overcharged, can hardly be asserted when it is considered that they rest, not on opinions or theories, but on facts which admit of no doubt. The money collected is in the Treasury, the Government accounts are clear of balances, and the improvements in the condition and spirit of the inhabitants are matters of netoriety throughout the zilla. The improved state of Indapoor was noticed in my letter (No. 216) dated the 26th January last, and in replying to that letter Government observed (vide your letter No. 1489, dated the 19th April), "The improved state of the Indapoor Pergunna, once the very centre of mismanagement on the part of our subordinate officers and oppressors of peasantry, is a source of high satisfaction to the Governor in Council. It affords an instance of successful results to which, however liberal and benevolent our measures may be, we are not always accustomed."

- 9. We are apt to speak and think of the effects as if they resulted from some new principle in revenue, management, or some system which had been tried in Indapoor for the first time. Nothing, however, can be further from the fact. There was little in the principle of the present revision, or in its mode of execution, for which an example might not be found either in a good native assessment of the Deccan. The chief features which distinguish it from its predecessors are the care and attention with which all the details have been executed and the sound good sense and the strict adherence, where practicable, to former usage. Its leading principle has been to fix an assessment so moderate and so simple as to be easily and readily paid by a poor and simple population.
- 10. The reports of Lieutenants Nash and Wingate are so full, clear, and satisfactory that they require little comment.

There are, however, a few points in the letter from the Principal Collector which seem to call for some remarks.

- 11. The remarks Mr. Mills makes in his 4th para, regarding the correctness of the survey measurements may lead to some misapprehension, unless it be borne in mind that they, as well as the rest of the work, are generally supposed to be less vitiated by wilful errors in the Indapoor Pergunna than anywhere else.
- extremely low when compared with the Mamool and survey rates, though he subsequently allows that they are probably as high as they should be. It would, however, have been but fair to have pointed out that, with anything like the prices of the last ten years, the Mamool and survey rates were merely nominal, and never were, nor ever could be, fully realized; and it would not have been out of place had Mr. Mills alluded to that part of Lieutenant Nash's report in which he shows that, considering the prices of produce, the present assessment is very nearly the same as the Kumal and Tunka were at that time in the periods during which they were respectively in force when agriculture was most flourishing.
- 13. The observation made in this paragraph (para. 7) by Mr. Mills, that "the present state of the Indapoor Pergunna is

to a certain extent fictitious," is in part true if he meant that it is called flourishing by comparison relatively with the surrounding districts, and that it would not be so called in a rich and wellmanaged province. There can be little doubt but that if the measures which have been pursued in Indapoor are steadily followed up in the surrounding districts, Indapoor itself will become one of the poorest from being, as it is now, one of the most (perhaps the very most) flourishing districts in this zilla. But there can be equally little doubt that the alteration will be comparative, not real. Of all the districts in the Deccan it is perhaps the least favoured by nature; and as those which enjoy greater natural advantages participate in the benefit of measures which have done so much for Indapoor, they will rise in the scale, and from their superiority in other respects rise higher than Indapoor. by no means follows, nor does there appear any reason to apprehend, that when this very desirable consummation approaches. Indapoor will any degree sink below its present standard. Least of all do I apprehend that the effect anticipated by the Principal Collector in the latter part of the puragraph will ever take place to any extent, simply because amongst those who have of late years flocked to Indapoor the proportion of those who are Wuttundars of our own districts is belived to be small compared to those who belonged originally to Indapoor, which they left, some as long as the famine of 1803-4, when they fled to the Moglace or other foreign districts, where there is little chance of their being again driven by the advancing prosperity of the pergunnas around Indapoor.

14. I confess I do not agree with the Principal Collector and Lieutenant Nash in finding fault (para. 9) with the principle adopted in the late survey, of taking 55 per cent. of the net produce. Lieutenant Nash argues as though Government were the universal landlord and the cultivators its servants, and if that were the case it would undoubtedly be unjust to leave one man a greater proportionate share of the fruits of his labour than another, and impolitic to take less than what each man should receive for his subsistence. But if the object of an assessment be to impose a land tax, the plan of taking a certain share of the net produce is the only

one by which that tax can be fairly fixed, and it is the only means by which any interest can be created in the land stronger than that local attachment which the coonbie has for his fields; nor is the comparatively higher assessment of inferior soils (in the sense in which the expression is used by Lieutenant Nash and the Principal Collector) which is caused by such a system to be deprecated. It is perfectly natural and most profitable for the cultivator that the best soils should be the first cultivated as those which, in proportion to the capital and labour employed on them, yield the best return, and when our fiscal arrangements invert this natural order of things it is a clear proof that there is something radically wrong in our system. Except to guard against future error, however, there seems little use in arguing the point, which, as far as the present assessment is concerned, appears to be purely speculative.

- that the power of affording water for irrigation is one of the most valuable of the capabilities of land, and that to bear it in mind in fixing an assessment is therefore strictly consonant to the orders of the Honourable Court. This is a question quite distinct from that as to whether it is worth while to levy a separate assessment when the quantity of the irrigated land is so small, and where its extension is so desirable as in Indapoor; but for my own part I see no exjection whatever, as regards Indapoor, to levy a higher assessment on Bagayet than on Jerayet lands, provided that assessment is in reference to the capabilities of the land. That the new rate fixed at Indapoor is moderate there can be no doubt.
- Collector gives his reasons for dissenting from the proposition of Lieutenants Wingate and Nash, that the present settlement should be extended for a period of 30 years if not rendered permanent. Mr. Mills first argues that by the great increase in the quantity of the grain produced beyond the demand for it, the price of the precious metals (as compared with grain) will rise so high as to render the present low assessment too heavy. To this I would answer—first, that even if the land were given rent free, the quantity of grain produced could never for any considerable period be augmented

beyond the demands for it; and, secondly, that even if the objection were a valid one to saying that Government will always take the present assessment at neither more nor lass, it could be no obstacle to Government declaring that for 30 years or for ever it would limit its demand to the present assessment, and it is this, and not a declaration of the immutability of an assessment, which is required to give anything like permanent prosperity to the country.

- 17. Of the two contingencies apprehended by the Principal Collector, let it be supposed that one, viz. "an increase in the value of the precious metals making that" (assessment) "onerous which was originally light," were to happen subsequent to Government having given its ryots an assurance similar to that recommended by Lieutenant Wingate-the Principal Collector justly remarks that good policy and humanity necessarily oblige Government to reduce the assessment; and how, it may fairly be asked, would the difficulty of doing this be increased by such an assurance being given. The change in the value of the precious metals can never be caused or prevented by the term for which the assessment is fixed being ·longer or shorter, except that the longer the term the less will be the liability of change in prices of produce and everything connected with agriculture, and should that change take place so as to render the present assessment too heavy, it must be reduced, or the country will be ruined, whether the term be one year or a hundred.
- 18. But from what the Principal Collector says in his 12th para., "that Government must always be losers and can never be gainers," and from his reflections on the impossibility of Government raising the assessment, and indeed the whole tenor of his argument, it is pretty clear that it is the other contingency, viz. that by money becoming more plentiful the prices of produce will rise, which he has chiefly in view in objecting to extend the term of the assessment beyond 10 years. He appears to have hopes that the circumstances of the country may so alter after the expiration of the 10 years as to enable us to raise our demand. It is the continued pursuit of some phantom advantage of this kind which has hitherto prevented most of our districts from improving to the degree which we might fairly expect from so many years of

British Government, and which, if we persist in following, will alike effectually bar any decided amelioration in the circumstances of our subjects and in our own revenue. Even admitting that such hopes of being hereafter able to increase our demands were justifiable in most cases, what can be the advantages which the Principal Collector expects beyond the very solid ones which the present revision has secured. As regards the 'ryots, the assessment is lighter and more easily paid, agriculture is more extended, and the people are more contented and more rapidly improving circumstances than at any period since we had the country. regards Government, the district is managed without trouble; the sum which the pergunna now actually yields (and which is annually increasing) to the Treasury is more than the average since we have had the country. It is realised without difficulty or complaint, whilst little room is left for peculation or oppression setting aside the benefit which may be expected from a measure which will create a permanent interest in the land, and induce the holders to lay out capital on it. Why should we leave the only course which can secure and increase these great solid advantages for the sake of some vague and very uncertain hopes that we may hereafter be able to raise annually a few thousand rupees more from the pergunna?

leases of land for more than 30 years; but it is to be hoped that, for the very sufficient reasons given by Messrs. Wingate and Nash, and for the very obvious one of continuing to the district the only system under which it has ever prospered under our rule, Government may see fit to declare that for 30 years no increase will be made in the present rates, and to request the sanction of the Honourable Court to a pledge being given, that if the opinion of the people at the end of that period be in favour of a continuance of the leases at the present rates they shall be declared permanent.

I have the honour to be, &c.

T. WILLIAMSON,
Revenue Commissioner.

Poona, Revenue Commissioner's Office, 12th October 1838.

# Appendix No. V.

No. 4739 of 1838.

To JOHN VIBART, Esq.,

Revenue Commissioner.

TERRITORIAL DEPARTMENT, REVENUE.

SIR,—I am directed to acknowledge the receipt of your predecessor's letter (No. 2297), dated the 12th October last, submitting a report from Lieutenant Nash on the mode in which the survey and revision of the assessment in the Indapoor district have been conducted, and, in reply, to communicate to you the following observations and instructions which have occurred to the Right Honourable the Governor in Council on the various points treated of in those letters.

- 2. The minute details, not only of the principles on which the whole scheme was conducted, but even of that part of the execution of the survey which refers to the conduct of the measurements and classifications by the subordinate agents, the regulations under which they proceeded, and the means adopted for testing their work and checking fraud, would, I am directed to remark, have been acceptable to the Government, and equally so, no doubt, to the Honourable Court. These details have not been touched upon, nor are many points connected with them to be discovered in the "sketch" or memorandum which forms an accompaniment to Mr. Mills' letter.
- 3. The first process in a work of the nature now reported on is the measurement of the land. In by far the largest portion of the pergunna the measurements made by Mr. Pringle's surveyors were found free from great inaccuracies. The villages in which great discrepancies were discovered were remeasured, and this preliminary part of the process was thus placed on a satisfactory footing. After the tests to which it has been subjected, the correctness of the mere measurement must be held to be established.

- 4. The next process is the classification of the soils. That of Mr. Pringle is denounced as worthless, and his process had therefore to be commenced anew. The system adopted of dividing all the lands into three grades is described by Lieutenants Nash and Wingate, as also the establishing a relative proportion between each different class.
- 5. The next and final measure of the settlement is the determination of the rate of assessment; and, in respect to this process, Government considers the information which the present papers afford as somewhat defective. The classification only goes so far as to determine the relative productive powers of soil; all considerations of the extrinsic qualities which different fields may possess, such as the facility of irrigation and of procuring manure, the vicinity of the village, the neighbourhood of good roads or markets, &c. has been studiously excluded.
  - 6. Lieutenant Wingate in para 5, I am instructed to state, observes that these points, though disregarded in the classification, have been carefully noted with the view of finally assisting in fixing "the assessment;" and from this it might naturally have been supposed that, by some process subsequent to the mere classification of the soil, due weight would be allowed to these qualities, which in truth affect the capability of the cultivator to pay his revenue equally as much as the possession of different classes of land.
  - 7. Neither Lieutenant Wingate nor Lieutenant Nash, however, shows in what manner the information gathered by the Turrims on these points has been made to bear upon the rates of assessment. Mr. Mills in his para. 5 implies (not withstanding the passage of Lieutenant Wingate's letter above quoted) that these points have been entirely left out of the calculation. Had such been the case, executive officers ought surely to have noticed it, and to have shown the grounds on which such omission was to be defended.
  - 8. It is difficult at present to see the connection between the rate of assessment and the classifications. The latter merely fixes the relative productive powers of each kind of soil. If these

were fixed with accuracy, and the positive productive power of one kind were known, we should have that of all the rest, and the next question would then be, what portion of such produce should form the Government demand.

- 9. From Lieutenant Nash's report it would seem to the Governor in Council that, in order to avoid errors similar to those which occasioned the failure of Mr. Pringle's survey, the rates have been fixed on a rough estimate of the productive powers of each field, and according to the proportion of each of the nine classes of soil which each may contain. The rates of these classes are said to have been derived from local inquiry and the experience of qualified persons, without any very minute investigation into actual produce or actual expenditure. The applicability of such rates must entirely depend on the degree in which the farmers of these were qualified for the difficult and delicate task of preparing them. There is no test to which they can be subjected, except that of experiment, for a fair series of years.
- 10. The discussion of the causes of the failure of Mr. Pringle's survey has led to a considerable difference of opinion between Mr. Williamson on the one hand and the engineer officers, supported by Mr. Mills, on the other. The causes alluded to are, the effect of the survey in reducing the rates on the best and raising them on the worst soils, and the assumption of the average of past years' prices as the basis of the money settlement.
- 11. It is on the first point that the discussion arises. Lieutenant Wingate and Lieutenant Nash urge that the system of fixing the assessment at 55 per cent. of the net profit leaves a far greater surplus to the ryot on fine land than on inferior soils, making the calculation on so much of each kind as can be cultivated at a certain expenditure. To support this view Lieutenant Wingate has framed a table, showing in a clear manner the result which will be described. This view of the subject certainly tends to remove much obloquy from the actual performer of the measurements and classifications, and from the assessors to whose venality this result was mainly attributed; but this is at the expense of the theory on which Mr. Pringle's plan is based.

- 12. Your predecessor, on the other hand, alleges that the view above described might be applicable between a landlord and a tenant, but that it is not so when the intention is to fix a land tax. It is not necessary, as noticed by Mr. Williamson, to carry on a discussion on the subject, for any practical purpose, in the present instance. But I am directed to observe that Mr. Williamson's principle carried to extremity will seem to end in the abolition of all difference of rate or classification, and the settlement of one uniform rate for land of all qualities.
- 13. Lieutenant Nash's remarks (para. 15) on the uselessness, in establishing an assessment in money, of an average of prices during a period when they have been gradually falling, and while the very causes which have occasioned such fall are actively in operation, are very just, since an assessment founded on such averages must totally be inapplicable, even to the first year of a new series; while its inapplicability will be greater and more apparent each succeeding year.
- 14. The financial result of the measure is shown by Lieutenant Nash in para. 17. Lieutenant Wingate carries it on to the succeeding year (1837-38) in para. 12, and Mr. Williamson shortly notices it in para. 4.
- Governor in Council, though the isolated fact of an increase of revenue, or even the absence of outstanding balances, is no uncring proof of the correctness of the system which has been adopted. The same result might have been obtained from more effective supervision having diverted from the proper channel for it may be the effect of excessively low rates drawing cultivators from neighbouring districts at the expense of the revenue and prosperity of those they have left.
- 16. Under the former system, I am desired to observe, it is notorious that far more was collected than was ever allowed to flow into the coffers of the State. In certain villages, mentioned in the 28th para. of Mr. Williamson's letter of the 26th March 1838, the actual payments by the cultivators were more than double the

Government revenue; and it may not be too much to assert that this system prevailed, though perhaps not to so great an extent, throughout the talooka. Hence it would seem that the mere amount of the receipts by Government under an ill-regulated and corrupt establishment is no fair criterion of what has been extracted from the people, or what they can fairly pay; and supposing the malversations and undue exactions by the patels, koolcurnies, and others to have been checked (as it must be presumed they have now been), it is a self-evident conclusion that the revenue of 1836-37, supposing nothing to have been paid but to Government, must be the consequence of an enormous reduction in the rate of assessment.

- 17. In stating the result in para. 17 it may be doubted whether Lieutenant Nash is right in having excluded sums collected on account of outstanding balances. A district paying for a series of years Rs. 50,000 for the current year, and Rs. 10,000 for balances of those preceding, may fairly be considered as capable of paying, and as paying, Rs. 60,000 annually.
- 18. The effect, however, of the whole measure, as having established a low scale of assessment in this pergunna, is evident to the Governor in Council. The question is not whether it is low enough, but whether it is not too low. No one will hesitate to admit that a moderate assessment is a blessing to both Government and the people. The great difficulty is so to fix the assessment that while it affords to the State its fair dues, it shall not encroacing the just share which the agricultural classes ought to derive from the land.
- 19. The necessity of a reduction of assessments is discussed by Lieutenant Wingate in para. 13, &c. He explains the causes of the low prices which have obtained since our conquest, and their effect in discouraging the growth of wealth and comfort among the peasantry: while no corresponding reduction was made in the Government money rental. His remarks are just, but they are too partial. They show that the existing assessment was too

high and ought to be lowered, but they afford no data to judge of the extent to which such reduction should be carried.

- 20. The mode adopted for the assessment of the Bagayet is, I am directed to add, described in paragraphs 23 and 27 of Lieutenant Nash's report. It is virtually a well tax, each well being rated as being able to irrigate a certain number of acres, each acre paying a fixed assessment of Rs. 2 independent of and beyond the Jerayet rate. No mention, however, is made of Pathstul irrigation, and it may therefore be presumed that none is to be found in this pergunna.
- 21. The limited extent of Bagayet lands in this district prevents the question of their assessment being here of great importance. Mr. Mills in para. 10 advocates the total abolition of all extra assessments on watered lands, and supports his recommendation by an appeal to the Honourable Court's orders, that "land should be assessed according to its capability and not according to its produce." But this, as Mr. Williamson justly observes, is clearly his misinterpretation of the Court's instructions. The capability of the land depends as much on the facility for irrigation and local peculiarities as it does on the colour, depth, and other qualities of the soil.
- at higher rates than Jerayet is one which must be admitted generally; and the only question is, whether in a district such as Indapoor, where water, even for domestic purposes, is in many seasons deficient, and where therefore the sinking of new wells and the preservation of those already built, are objects of vital importance to the comfort of their inhabitants and the preservation of their cattle, it might not be advisable to suspend the operation of this principle in order to encourage these desirable results. Your predecessor has stated his opinion that the rates fixed are low, and that the country is well able to bear them. The engineer officers seem of the same opinion, and the Honourable the Governor in Council therefore considers it unnecessary to direct any change to be introduced.

- 23. The period during which the present survey and assessment is to be secured without enhancement to the ryots is next to be considered. Lieutenant Wingate is disposed (para. 17) to a permanent settlement, or at least to one of thirty years' duration, instead of the term at present fixed, of ten years. This reasoning is of a general nature, and applicable to the general question, whether a permanent is not, cateris paribus, preferable to a temporary settlement. Your predecessor, I am instructed to state, is a strong advocate for permanency, while Mr. Mills argues on the other side, and it must be admitted that his arguments are weighty, and deserving of serious consideration.
- 24. It must not be forgotten that the very causes which have been cited as the grounds for the present measue are still in full operation. The price of grain is still falling, and it is impossible to say whether the average of the next 10 years may not be as much below that of the last as that was of the 10 years preceding. Where there is but one staple produce in the country, as is unfortunately the case in these districts, and that staple grain, there is far more probability of such a result than in a country producing articles of export, or for manufacture, within it, even though the value of the precious metals should remain stationary. On the other hand it is impossible to foretell what may be the result of the continuance of our rule, and of those measures for the improvement of the country and of the condition of the people, which we are gradually introducing.
- 25. Added to this is the consideration that the present is but an isolated experiment. The extension to the whole of the Deccan of the same measures and the same rates of assessment as those introduced into Indapoor may, the Governor, in Council conceives, be productive of results which will materially affect the now apparently flourishing condition of that talooka. Enjoying now advantages which are confined to it alone, it is not to be expected that the elevation of all the surrounding districts towards its level will not be attended with some corresponding depression of Indapoor. The height to which it has been raised may prove rather relative than positive, and, if so, an adherence to the present

measure as a permanent settlement may produce the very evils which it is so desirable to avoid. Numerous failures ought, moreover, to lead us to hesitate before placing ourselves in a position from which we cannot retrace our steps. It is very true, as Mr. Williamson argues, that by fixing the present as maximum rates, we can always step forward to relieve the agricultural classes by further reductions, but the present rates have not, it must be confessed, been fixed on so perfect and decisive a principle as would justify Government in limiting its demand on the land to them under every change of circumstances to which the country can by any possibility be liable.

- 26. The Governor in Council therefore conceives that it would be preferable to adhere to the term first fixed of ten years, say from the commencement of the present season (1838-39). Assuming that the two preceding years have been years of probation—the revision having taken place but partially in 1836-37, and having been extended throughout the pergunna in 1837-38—there can be no objection to declare the intention of Government, at the expiration of this period, to continue the settlement for a further term, should the beneficial effects expected from it be found to have resulted.
- 27. Lieutenant Wingate concludes his report with remarks on certain points of revenue management which have not been noticed by Mr. Williamson; these are—
- 1st.—The impolicy of granting cowls for the cultivation of land at rates lower than the fixed assessment at present of the Indapoor Pergunna.
- 2nd.—The evil of the system of obliging or inducing a ryot to undertake the cultivation of more land than he may himself desire or be able fully to prepare.
  - 3rd.—The preservation of the boundaries of fields.
- 28. On all these points Lieutenant Wingate's remarks are just, and you are requested to issue instructions in conformity with them to the Collector.

29. The preservation of boundaries should be the particular duty of the village officers, for it is almost impossible that any alteration can be made without their privity or connivance. It appears to the Hohourable the Governor in Council doubtful whether a fine can legally be imposed on the owner of a field who thus transgresses; but he may be subjected to the assessment on the extra land, and thus, coupled with the responsibility of the village officers, and with vigilance on the part of the Mamlutdar and his subordinates, may check the practice of encroaching on the Government waste.

I have the honour to be, &c.

L. R. REID,

Acting Chief Secretary to Government.

RIGHT HONOURABLE SIR,

We have the honour to forward, for your information, a copy

Letter from Licutenant Colonel Francis, Survey and Settlement Commissioner, No. 298, dated 16th April 1867.

Government Resolution No. 1550, dated 20th

April 1867.

Letter from the Revenue Commissioner S.D., No. 2026, dated 22nd May 1867, with accompaniments.

Government Resolution No. 2107, dated 4th June 1867.

of the papers noted in the margin relative to the revision of the assessment of the Indapoor Talooka in the Poona Collectorate.

2. It will be observed that before disposing of this subject we have resolved on awaiting the receipt of Sir George Wingate's opinion, which Lieutenant Colonel Francis will submit to us after consulting that gentleman. We shall then have the honour of further addressing you on the subject.

We have the honour to be,

Right Honourable Sir,

Your most obedient, humble Servants,

W. R. SEYMOUR V. FITZGERALD.

R. NAPIER.

B. H. ELLIS.

S. MANSFIELD.

Revenue.
No. 59.

India Office London, 14th Scytember 1867.

To His Excellency the Right Honourable

. the GOVERNOR in COUNCIL, Bombay.

Sir,—I have to acknowledge the receipt of the despatch from your Excellency in Council of the 24th June last (No. 20), with which you foward copies of papers relative to the revision of the Assessment of the Indapoor Talooka of the Poona Collectorate.

2. As you have resolved on deferring the disposal of this question until you shall be in possession of the opinion of Sir George Wingate on the proposals of Lieutenant Colonel Francis, which the latter officer, now on leave in this country, has been authorized to obtain, I shall await the receipt of a further communication from your Government. The subject is of unusual importance, for as Indapoor is the first district under the revised thirty year's settlement of which the term is on the point of expiring, the principles new approved will doubtless be applied to the re-settlement of the other portions of the Southern Division of your Presidency, and should therefore be most carefully considered.

I have, &c. STAFFORD H. NORTHCOTE.

No. 3725.

Revenue Survey and Assessment.

REVENUE DEPARTMENT.

Bombay Castle, 31st October 1867.

Despatch from Her Majesty's Principal Secretary of State for India, No. 59, dated 14th September 1867—Noticing the despatch of this Government, No. 20, dated 24th June 1867, relative to revision of the Assessment of the Indapoor Talooka of the Poona Collectorate.

RESOLUTION.—Colonel Francis should be furnished with a copy of this despatch.

To the Survey and Settlement Commissioner N.D. (with copy of the Despatch).

### No. 828 of 1867.

#### REVENUE DEPARTMENT.

To the Acting Chief Secretary to Government.

Poona, 7th October 1867.

SIR,—Referring to Government Resolution No. 2107, dated 4th June last, I have the honour to submit herewith a Memorandum upon my proposals for the re-settlement of the Indapoor Talooka, prepared by Sir George Wingate during my recent visit to England.

- 2. Sir George Wingate's remarks upon this subject will, I am sure, be read with interest by Government, for the active part taken by him in the first settlement of the Indapoor district, and his ripe experience in all questions connected with the Survey of the Presidency, makes his opinion upon the subject peculiarly valuable. There are one or two points noticed by him upon which I have a few remarks to offer, but I shall not attempt to follow him through the course of his arguments, leaving it to Government to decide the few minor points of difference in our respective views upon what has already been recorded in the Report.
- 3. In paragraph 3 Sir George has indicated some further statistical information which he thinks it is desirable to place on record in this case as well as in future reports. The general returns enumerated by him have for the most part been prepared in my office, but as the Report and its accompaniments had become very voluminous, I purposely omitted them. But as Sir George attaches considerable importance to them, I purpose preparing amended returns, to be framed so as to include the additional information alluded to as well as that originally embodied in the Report. These returns shall be submitted hereafter as a supplement to the Report. A map of the district, which is specified as one of the requisite documents, has been embodied in the Report, though copy of it was not sent to Sir George in the first instance.

- In his remarks upon statistical information, Sir George has also suggested that a regular form of return should be prepared for each district as brought under re-settlement. It would be most desirable to have a uniform system of return for all the several survey departments, as here proposed. At present each Superintendent, as a rule, adopts his own particurlar way of showing the statistics of a district, and as a consequence there is considerable dissimilarity both as regards details as well as in the manner of exhibiting them. The compilation therefore of a uniform return for all the districts of the Presidency, which is a most desirable measure, is impracticable. Acting therefore on the hint thrown out by Sir George, I would suggest that the Survey Commissioners, after conferring with the several Superintendents of Survey, should prepare a form of statistical return for general adoption throughout the Survey departments. As these returns are received they should be compiled by districts in the Survey Commissioner's office, which might then be made the regular statistical office of the Presidency. No expense will (at first at any rate) be incurred by the introduction of this plan, for the work could be done by the present office establishment. The form that may be agreed upon by the Survey Commissioners might be sent to Government through the Revenue Commissioners, who would thus have an opportunity of recording their opinion upon it.
- 5. I would draw attention to the remarks in paras. 6 and 7 upon the question of assessing lands irrigated from wells. Sir George considers that water obtained from sinking a well may be viewed as a mineral resource and be fairly taxable as such, after allowing for the expenses incurred in obtaining and making it available for irrigation. This is one of the best arguments I have yet heard in defence of the system of assessing well irrigation. For this, and for other reasons, Sir George dissents generally from my proposals for exempting lands from extra assessment on account of well irrigation. He thinks, however, that a drought-stricken district like Indapoor may be specially treated as proposed by me. If thought advisable therefore, my proposal might he held to be applicable only to Indapoor.

- George Wingate, though adopting a different plan of estimating the amount of the increase which may be imposed upon Indapoor at the revision assessment, has arrived at almost precisely the same result as I had worked out; that is to say, according to his estimate the increase should be 54 per cent. upon the present assessment, and my own estimate makes it 53. So near an agreement as this upon the complicated question of the re-assessment of a drought-stricken district like Indapoor is very remarkable, and at the same time it inspires confidence in the original proposals.
- 7. Sir George Wingate agrees with me in the expediency of fixing the amount of local tax to be levied during the lease simultaneously with the Imperial Land Revenue, and I would particularly refer to his observations upon this subject.
- 8. Sir George concludes his Memorandum with remarks upon the great advantages to the State, and to the people generally, of a settlement fixed for 30 years, and liable to revision at the expiration of that period, over a settlement fixed in perpetuity. He refers particularly to a paper upon the permanent settlement question which he submitted privately some years ago for the consideration of the then Secretary of State for India. I made inquiry at the India Office for this paper, but as it was not forthcoming there, Sir George has promised to send me a copy of it, which I shall submit hereafter on its receipt.
- 9. In conclusion I would solicit early orgles upon the Report, for I purpose, with the approval of Government, to introduce the new assessment during the early part of the coming season.

I have the honour to be,

Wour most obedient Servant,

J. FRANCIS, Lieut. Colonel, Survey and Settlement Commissioner.

# NOTES UPON COLONEL FRANCIS' REPORT No. 147, DATED 12TH FEBRUARY 1867, ON THE RE-SET-TLEMENT OF THE DISTRICT OF INDAPOOR.

- 1. The first 65 paragraphs of the Report are occupied with a very interesting history of the occurrences connected with the revision of the district thirty years before, and upon this portion I shall make no remark.
- 2. The comparison given in the 66th paragraph of the first year of the new settlement with the last of the old is defective, inasmuch as in that year the new settlement was, I think, introduced in the Kullus division. The preceding year 1835-36 might have been compared with the year 1837-38, after allowing for the extension of cultivation in the interim caused by the revision. In the extract of Sir Bartle Frere's speech given in the 78th paragraph there is a mistake relative to the Cart manufactory set up at Temboornee in the Sholapoor districts. This establishment was instituted by Lieutenant Wingate, and hundreds of carts were supplied from it to the ryots of theneighbouring districts of Sholapoor, Poona, and Ahmednuggur. Licutenant Gaisford subsequently introduced an improved model of a cart which was found more suitable to the Deecan, and gradually superseded all others. difficulty connected with the introduction of carts was the inability of the ordinary district artificers to construct or even repair them, and it would be interesting to learn to what extent this obstacle has since been supposed by the greater skill of the local artificers. Are the Indapoor carts now constructed in the district, or are they purchased elsewhere; and in this case, can repairs be effected in the district without difficulty? Satisfactory replies to these queries would indicate a marked improvement in the condition of the district, brought about by the revised settlement.
- . 3. The review of the benefits resulting from the new settlement contained in the 77th and following paragraphs up to the 107th paragraph of the report is cautious and discriminative. and calculated to give confidence in the perfect safety of the proposals

for an increase of the assessment, which Colonel Francis proceeds to found upon a consideration of these benefits. . It would, however, have added to the interest of his Report, and to our confidence in his conclusions, had the statistical information regarding the present condition of the district been more ample. It would be interesting, for instance, to know what proportion of the population is dependent upon agriculture, and what upon trade and manufactures; what is the average size of the holdings of the cultivators? What are their modes of husbandry? and is the land generally well cultivated? What proportion of the land nominally in cultivation is kept untilled for the purpose of affording grazing for the cattle, though subject to the full assessment? What are the ordinary corn and money rents received by non-cultivating occupiers from their sub-tenants? How does the ryot dispose of his produce? Poes he sell it chiefly at the local or distant markets, or is it handed over to the village banker in satisfaction of previous advances? What are the castes and religions of the people, and what the numbers of each denomination? What is the state of education, and the number and castes of the scholars? What is the state of crime and civil litigation in the district? What is the condition of the cross-roads of the district, and are they generally available for cart traffic, or otherwise? A statistical report for each district brought under re-settlement comprising these and any other interesting items\* of information, accompanied with a map indicating the positions and grouping of the general villages of the district for purposes of re-assessment, and showing the course of the nearest great highways and railways would be an invaluable aid in forming a judgment as a the proper rates of assessment, and form a most important record by which the future progress of the district could be correctly estimated. The information required might be obtained from the Revenue, Judicial, and Educational departments, when not capable of collection by the Survey establishments, and for this the assembly

<sup>\*</sup> Note.—Amended Returns exhibiting the information here alluded to are being prepared. See Survey Commissioner's letter No. 828, dated 7th October 1867, containing explanation on this point, and also regarding the causes of their not having been submitted with original Report.

of the various Survey and other departments at Poona during the monsoon months, affords facilities which did not exist when the head-quarters of the Survey departments were scattered over the country.

- Besides the Chowrees and Dhurumsallas entered in the table in the 97th paragraph of the Report as new buildings erected within the last thirty years, dwelling-houses, schools, and temples or mosques might have been enumerated. The statistical table appended to the Report gives no information regarding the three last; but it appears from it that exclusive of the villages of Navee and Borce, 460 additional tiled or flat-roofed houses, 2,122 thatched have been constructed under the new settlement, and if we adopt the very moderate estimate of 100 Rupees as the value of each of the former and 50 Rupees of the latter, this would represent a capital of 1,52,100 Rupees invested in dwella ing houses during the last 30 years, independent of old houses added to or entirely rebuilt; an addition also of the personal property of the inhabitants should be made on account of an increase to the extent of 9,000 sheep and goats, to the items of the table give in the 101st paragraph. Considering the imperfect nature of the experimental operations connected with the measurement and classification of the lands of the Indapoor district, Colonel Francis was, I think, right in deciding upon an entirely new classification and survey, as described in the 108th to the 125th paragraphs of the Report, but this course it is probable will only be found necessary in districts where the original operations were of a like incomplete character, and carried out before the system of laying down permanent field boundary-marks in the course of the survey operations had been matured and practically carried out.
- 5. The principles on which the revision of assessment should be based, as described in the 128th and 134th paragraphs, appear to be quite sound so far as they go, but they should not be considered to embrace every case, as it is possible that occasions may arise for raising the assessment upon grounds not specified in any of these paragraphs.
  - 6. The question of excepting improvements made with the

cultivator's capital, considered in the 135th and following paragraphs, is an important one, but tlemands very careful consideration in its practical application. The Survey Act limits the discretion of the revising officer more than is perhaps desirable by the enactment in the concluding part of Section 30; that "such revised assessment shall be fixed, not with reference to improvements made by the owners or occupants from private capital or resources during the currency of any settlement under this Act, but with reference to general considerations of the value of land, whether as to soil or situation, prices of produce or facilities of communication." Colonel Francis considers that this provision clearly exempts land brought under irrigation by the construction of a new well, or the repair of an old one, from the imposition of additional assessment on that account. I am not satisfied of the correctness of this view, and although a decision may not be of much importance in the case of Indapoor, it may be, and probably would be so in other districts where well irrigation is extensively carried on and admits of great development. The application of the cultivator's capital to the construction of a new well or the repair of an old one does not create water for irrigation, but simply provides means for raising the water, stored in the subsoil, to the surface and applying it to the land. The well is the production of the cultivator's capital, but the water is not. The operation is exactly analogous to the opening of a new mine, until which time the subterranean mineral lies useless to man and yields nothing to the proprietor of the land in which it exists. But when once capital has supplied the means of bringing the mineral to the surface in a form suitable to man's wants, it immediately soquires value, and yields a rent or royalty to the proprietor of the land from which it is extracted. Water, like minerals, is a subterranean product, of great value in tropical climates, and therefore capable of legitimately yielding a rent to the lord of the soil, who is the Government in the present case. Colonel Francis estimates the average cost of the new wells constructed in Indapoor at 400 Rupees each, 5 per cent. on this capital, i e. 20 Rupees, with an addition for the replacement of the capital in 50 years, which may be considered as the duration of an ordinary well, together with an Rupees in all, would be an adequate return to the cultivator for the expenditure of his capital; and if the additional value conferred upon the net returns from the land irrigated from the well over and above those obtained from it when cultivated as dry crop should exceed 30 Rupees, then this surplus forms the value of the water which was previously an undeveloped capability of the land, and may most legitimately be made the subject of additional assessment.

- I am unable therefore to agree with Colonel Francis in considering the conversion of dry crop into garden land by the construction of a new well or the repair of an old one, to be in all cases excluded from increase of assessment by Section 30 of the Survey Act. I would not, however, propose to apply to such land any higher rate of assessment than the maximum dry crop rate which Colonel Francis has recommended, though I think it might be desirable to record all land irrigated from wells separately from the ordinary dry crop, with the view of presenting accurate statistics of the settlement, and of facilitating the imposition of special rates of assessment on garden land at a future settlement, should that course be then deemed desirable. It may be further mentioned in support of this suggestion, that should the district ever be brought under irrigation by means of a Canal from the Moota or other river, which is referred to in the 189th paragraph of the Report, the saturation of the soil by this means would probably give a great extension to well irrigation, so that the question of an additional assessment for that description of cultivation might rise into importance.
- 8. New rice land made out of dry crop land at the ryot's expense, Colonel Francis also considers to fall under the exemption contemplated in Section 30. This view does not seem to be so open to question, though a good deal might be said on the subject of the situation of the land and the additional value of the produce resulting from its conversion into Rice lands. Where the situation is favourable so that the return is large compared with the expense of conversion, this higher value is due as much to the

inherent advantages of the locality as to the application of the cultivator's capital, and a higher rate of assessment might on that account without unfairness be imposed, and as the question is not a practical one in the case of Indapoor, which is not a rice-growing district, I think it would be impolitic for the Government to foreclose it before the revision of the settlement of a rice district comes on for consideration, and however it may be settled, the converted land should, I think, be recorded in the Survey registers as Rice land, in order to preserve correct statistics of the cultivation at the time of settlement.

- 9. I agree with Colonel Francis in the propriety of imposing hereafter a building rate instead of a lump sum on land appropriated to building purposes; but I do not consider that the amount of such a rate would in all cases be satisfactorily determined beforehand at the revision of a Survey Settlement. Such land in certain cases, owing to the rapid increase of towns, might become of very great value, so as to render inapplicable any rate deduced from a consideration of these towns at the time of the Survey Settlement. Such cases would appear to be best provided for by special decisions as they arise, and in the case of towns having Municipal revenues, the building rents being due to building speculations by the townspeople, might, I think, justly be considered as belonging to the Municipal rather than to the general revenue.
  - 10. Colonel Francis explains in the 141st and following paragraphs of his Report his recommendations for the revision of the Indapoor rates of assessment, which he chiefly, and very properly in my opinion, bases upon the alterations that have taken place in the prices of agricultural produce during the last 30 years. He gives a table of these prices in the 146th paragraph of his Report, which he divides into 3 equal decennial periods, showing the average price of Jowarree, the staple product of the district, to have been 56½ seers per rupee for the first, 45½ for the second, and 26½ for the third, and he concludes that the assessment at the close of the first decennial periods was not light when gauged by the prices of that period, and that the cultivators were

not in a position to pay a higher assessment. He infers therefore that it was not till "towards the end of the second decennial period the cultivators had acquired that amount of capital and that well-to-do position which we would assign to them as the increase of profit to be left after payment of the Government assessment." And he concludes that this average of 42 seers per rupee should be taken as the index or starting-point for estimating the increase which may be made to the present assessment in consequence of the further rise of prices which took place in the last ten years of the settlement, and which he shows in the 156th paragraph to have been between 50 and 60 per cent. for which he proposes to provide by fixing the future maximum rate at I rupee per acre, which will raise by 53 per cent. the present assessment of the district. The increase here proposed seems to me to represent very accurately what is due to the altered circumstances of the district without taking into account the extraordinary rise in prices during the last five years, due to the American war, and which Colonel Francis in the 149th paragraph himself considers to be exceptional. But while agreeing in the accuracy of his general conclusion, I am unable to assent to the theoretical reasoning by which he supports it, for this requires us to admit that the rates of assessment during the first period of ten years were too high, which is contradicted by the marked extension of cultivation and amelioration in the condition of the cultivator which took place during that period. There can be no doubt whatever that during that period the district made considerable progress, but as prices did not rise, there was nothing to call for an increase of assessment, though there was sufficient improvement in the condition of the district to show that the original Survey assessment had not been pitched too high. During the latter half of the second decennial period and during the whole of the third the wealth of the cultivators increased of course more and more rapidly under the influence of the everrising prices, and this affords valid reasons for increasing the rates of assessment. The true inference appears to be that the original rates were suitable, and we should regard the prices of the time when they were settled as the index or point of departure by which

to regulate the increase to be now made, instead of the latter years of the 2nd period, as assumed in the argument of Colonel Francis. If the table of prices be attentively examined without reference to equal decennial periods, it will be found capable of subdivision into three well-marked periods. The first is a period of low stationary prices without any more marked oscillations than may be fairly ascribable to seasons of comparative abundance or scarcity. This period embraces the 14 years from 1836-37 to 1849-50, when the average price of Jowarce was 54 seers per rupee, or almost the same that was obtained at the introduction of the settlement, the average price for the 5 years preceding that event having been 53½ seers. The second period is of 11 years, from 1850-51 to 1860-61, and is one of advancing prices, due probably to the increasing wealth of India arising from the introduction of English capital for the construction of the Railways and for suppression of the mutinies, as well as from improvements effected in the internal communications of the country. The average price of Jowaree during the whole 11 years of this period was 39 seers, and for the last 5 years of it 35 seers per rupee. The 3rd period extends over the last 'five years of Colonel Francis' table from 1861-62 to 1865-66, during which prices received another extraordinary advance, due to the increased demand for Cotton, arising out of the circumstances connected with the American war. The average price of Jowaree for these 5 years was 18 seers per rupee.

and the prices then obtaining are so clearly due to temporary causes, that it would be most unsafe to take them into account in the formation of a basis for a revision of the rates of assessment intended to last for another term of 30 years. The price of cotton, upon which the price of Jowaree and other agricultural products in a great degree depend, has already fallen considerably since Colonel Francis' report was written, and is likely to fall much further. This has already affected the exchanges, and will materially diminish the amount of bullion to be received by India in the present year. This effect it may be anticipated will be experienced to a greater extent in future years until prices recover their normal condition, which it would not, I think, be

safe to estimate at a higher figure than those obtained during the last five years of the second of the above periods, when Jowaree was sold at 35 seers per rupee.

The average price of the preceding period being 54 seers, the former indicates a rise of price equivalent to 54 per cent., which is the amount of increase upon the present rates of assessment that may fairly be imposed on taking into account the rise that has taken place in prices since the former settlement was made. This is as nearly as possible the amount of increase which the rates proposed by Colonel Francis will effect, as he states in his 158th paragraph that the increase will be 53 per If there were a prospect amounting to anything like a certainty of the high prices of the American war period continuing, then a very much greater increase than this would be justifiable. The prices of the last five years are 200 per cent. above those that obtained when the original rates of assessment for Indapoor were introduced, so that these might be trebled without danger to the prosperity of the district if the American war prices were to continue through the next thirty years; but, as I have said, we have no warrant for concluding that this will be the case, or that prices will certainly range above those immediately preceding the outbreak of the war. It may be that the developing trade and improving condition of the communications of the country will cause prices to rise still further; but on the other hand we have to take into account the lowering influence of the heavy tribute India will have to pay to England the future in the shape of Home Government charges, and interest of capital provided for her Railways and other public works. A very large export trade will be necessary to provide this, and if at any time the demand for Indian commodities should fall off to an extent that would make it needful to transmit bullion to England to meet these charges, prices in India would rapidly fall. Prices in India may then be said to be dependent on the capability of its export trade to pay for, not its imports alone, but also the Home charges and the interest of borrowed capital, in addition to the annual supply of the precious metals

consumed by India in manufactures and coinage. This is a critical state of affairs, and is likely to render prices of agricultural produce unstable. It would not then be safe to adopt a high standard of prices in revising the Survey Settlements, and be every way better to make the new settlements as liberal as the exigencies of the State will permit. Colonel Francis' proposals fully meet these conditions, and though it might be urged that they are needlessly liberal, as, independently of the American war, prices would have gone on advancing, still we cannot be certain of this, and an error on the side of liberality is a safe one, as it must be promotive of the prosperity of the district.

13. Colonel Francis proposes to assess all the villages of the district at one uniform rate, with the exception of the chief market town of Indapoor, for which, in consequence of its advantages, he suggests a higher rate in consequence of the rain-fall there being somewhat less certain than in the rest of the district. No further modification of the general rate is madoin consideration of greater facilities of transport possessed by some parts of the district as compared with otherse Colonel Francis states in his 105th para. graph that it is difficult to put a special value upon the increased facilities of transport that have been created since the former settlement was made. These increased facilities must be mainly dependent on the high-road and rail-road from Poona to Sholapoor, both of which have been opened within the last few years. Both I think enter the district at its north-western corner, and the road passes on through the town of Indapoor, keeping chiefly to the northern side of the district, while the railway keeps still further north, and only lies for a few miles within the limits of the district. The benefits arising from both constructions must therefore, I think, be more largely enjoyed by the villages whose lands slope towards the Bheema River, which forms the northern and eastern boundary of the district, than by the villages on the other side of the district, sloping towards the Meera River, which forms the southern boundary. These differences of advantage I should imagine to be sufficiently great to warrant a difference being made in the rates of assessment on that account. These differences would be indicated by the prices of grain obtained in the several villages were there markets there, but as Colonel Francis has viewed the prices of grain for the chief market town of Indapoor as applicable to the whole district, it is probable that he has not deemed the variation in prices due to distance from the great means of communication as of sufficient magnitude to call for any corresponding modification in the rates of assessment.

14. Colonel Francis intimates in the 179th paragraph of his Report that in addition to, and independent of the assessment imposed on the district on account of Imperial Land Revenue, a further separate cess of one anna per rupce will be levied for local improvements, and he recommends that, although Section 29 of the Survey Act provides that the 30 years' guarantee shall be limited to the Imperial Land Revenue, it should be extended also to the cess for Lozal improvements. Section 29 just quoted includes the imposition of a cess for the use of water for irrigation provided at the expense of Government, but I presume that Colonel Francis does not mean to include this cess under that for local improvement, to which he proposes to extend the guarantee so as to prevent anything more than one anna per rupee being levied on that account during the next 30 years. On this understanding, I entirely concur in the arguments used by him in the 179th and 180th paragraphs in support of his proposal, for I fully share his conviction, that the imposition of cesses on the Land Revenue for any purpose whatever in excess of the amount fixed for collection at the introduction of the settlement, would be viewed by the lambolders as a breach of the 30 years' guarantee, and tend to weaken their confidence in the stability of the settlement which it is of so much importance in every way to strengthen. The limitation of the cess of one anna per rupee for so long a period as thirty years may be viewed as interposing a serious bar in the way of future undertakings for the improvement of the district; but should this be experienced, the Government would still be free to raise the requisite funds for local improvements, by means of local taxes independent of the Land Revenue, and it would be far better to do so rather than weaken the landholder's

confidence in the value of the Government guarantee upon which the success of the Survey Settlements, and the future investment of capital in agricultural improvements, mainly depend.

15. Colonel Francis in the following paragraphs to the 186th recommends that the revised rates of assessment he has proposed should be declared incapable of increase for another term of thirty years, instead of the adoption of a permanent settlement by which the State would be for ever debarred from any prospect of further increase from the Land Revenue. This is a very important and large subject, requiring for its adequate discussion the consideration of many questions, which I think it unnecessary to enter upon here, as I had an opportunity some years ago of submitting privately for the consideration of the then Secretary of State for India my views upon it in a memorandum \* which I have not at present by the, but of which I hope to obtain a copy for Colonel Francis, to be appended to the present paper. The views taken in this memorandum entirely support the recommendations made by Colonel Francis, limiting the guarantee to 30 years, and thereby enabling the Land Revenue to participate, at the expiration of that period, in any improvement in the condition of the It could only be on consideration of the clearest necesdistrict. sity that the Government of India could be justified in debarring its successor from obtaining any accession to their resources to meet the ever-increasing wants of an advancing civilization, from the Land Revenue which hitherto has been the mainstay of Indian finance. In order to justify the adoption of so extraordinary a course, the clearest proof of the baneful effects of the present Land Revenue, and the superiority of some other mode of raising an equivalent amount, by taxation, would require to be brought forward. The Land Assessment, be it observed, is not a tax at all, but a share of the rent which the land yields to is possessors. This

<sup>\*</sup> Vide para. 8 of Survey and Settlement Commissioner's letter No.-828, dated 7th October 1867, to the address of the Acting Chief Secretary to Government in the Revenue Department.

share of the Land rent has from the dawn of history formed the great fund from which the expenses of Government in India have been defrayed, and in an agricultural country the land must ever remain the great source of production from which the necessities of Government will have to be supplied. The Government right to increase the Land Assessment is the property of the public, and forms a sacred trust, which, in my humble opinion, the Government for the time being is bound to transmit, unimpaired, to its successors; and I can hardly imagine any accumulation of evidence of the baneful effects of such a possession that would justify the Government in giving it up. So far, however, from such evidence being incontestable, Indian Revenue authorities are nearly unanimous in admitting that of all moves of raising a revenue yet tried in India, the Land Assessment is most popular, and that it would be utterly destructive of the welfare of the country, and indeed absolutely impossible to raise the same amount of revenue by other means. It has been proved incontestably besides in the case of the Bombay districts, that agriculture has improved, and the general prosperity of the country has been developed with as great rapidity as in any other part of India where permanent Settlements have been tried, and it follows therefore that no injurious influence whatever can be fairly attributed to the limitation of the duration of the Survey Settlements to terms of 30 years. This term is long enough to give the landholders confidence in the stability of the Settlement, and yet not too long to render valueless the right of the State to share in the advancing prosperity of the country. In Indapoor we have a case in point. This district may be viewed as an epitomé of India at large, which in its length and breadth is an almost purely agricultural community. In Indapoor at the expiration of the 30 years' Settlement, the Government is about to increase its resources by an addition of upwards of 50 per cent. to the Land Revenue, and with every prospect of this large increase being readily acquiesced in by the landholders, who will not abate by one jot the confidence previously entertained in the stability of their Land Settlement, or view the increase as in any way intrenching upon

their proprietary rights. The advocates then of the permanent Settlements are bound to show that this large additional revenue could be raised from this district by means of taxes which would weigh less heavily upon industry, and be at the same time more acceptable to the people at large. Until this is done, it would, in my humble opinion, be idle to consider the alternative of a permanent Settlement.

J. FRANCIS, Lieut. Colonel, Survey and Settlement Commissioner.

MEMORANDUM REGARDING PROPOSALS BY THE GOVERNMENT OF INDIA FOR THE SALE OF WASTE LANDS AND REDEMPTION OF THE LAND REVENUE.

In considering the policy adopted by the Government of India for promoting "the sale of waste lands in fee simple and the redemption of existing land revenue," it will be convenient to treat of the latter branch of the subject in the first instance as that of most importance to the future revenue of India, and an requiring for its elucidation a line of argument that also has an important bearing on the question of selling waste land in fee simple.

2. In the permanently settled districts, the redemption of the land assessment at a proper valuation, and the application of the proceeds to the extinction of a portion of the public debt of India, would leave the financial position of the Government unaltered. And in this point of view the terms upon which the proposed redemption in such districts should be permitted alone require consideration, but those proposed by the Government of India, for fixing the price at twenty years' purchase of the existing assessment, could not fail to operate disadvantageously for the

future revenue, as the process of redemption would in all probability be confined to times when the real value of the equivalent of the annual assessment exceeded twenty years' purchase. This objection would be met by provisions for regulating the capital sum to be paid according to the market price at the time of the Indian Government 4 per cent, rupee paper, on the principles adopted for the conversion of the land tax in England.

The general question of encouraging the redemption of the land assessment of India at the present time, even in districts where it is permanently settled, is, however, much more open to criticism. The measure is only suitable for a country in which capital is so abundant that the landholders are unable to devote profitably the whole of their accumulations to the development of the productive capabilities of their land, and are therefore in a position to apply the surplus advantageously in the redemption of the Government or other lines upon it as opportunities may But it is to be feared that this is very far from the condition of India generally, or even of the most flourishing parts of Bengal. The greatest want of India is agricultural capital, and it would be a positive calamity if by any inducements the landholders there could be tempted to withdraw any portion of their inadequate capital from agriculture to be swept into the public treasuries, when, as is admitted, it would not be productive of even financial benefit to the Government. It is not likely that this result will be realized, and more probable that the imagined boon of permitting the redemption of the land assessment will not be appreciated by the land kolding class; for it is difficult to understand, when the ordinary rate of interest on agricultural loans varies from 10 to 25 per cent., how it could ever serve the purpose of a landholder to invest his money at 5 per cent. in the redemption of his land assessment. There might be instances of wealthy landholders in Bengal and elsewhere, who have money invested in the public funds, who would be tempted to sell out for the purpose of redceming their land assessment, but this proceeding would have no effect either in advancing or retarding agricultural improvement. In all cases, however, of landholders applying their accumulations to the cultivation or improvement of their properties, it would be a positive mischlef for them to cut off this fertilizing stream from the land, and to turn it into the unproductive waste of the public treasuries. It is little likely that this class of landholders will do so extensively, but, in so far as the redemption may be carried out, it may safely be said that its action will either be valueless or hurtful.

- The foregoing observations apply equally to districts in which the land assessment is not permanently fixed; but as regards these, other most important considerations, affecting the development of the public revenues and the general productive resources of the country, require examination. For a permission to re-leem the land assessment in those parts of India is equivalent to fixing the existing assessment in perpetuity, as it could not be just to place one landholder in a worse position than another, or after having allowed the redemption of the land assessment in cases too numerous to be deemed exceptional, to declare that landholders who had not been able to redeem should continue liable to have their assessment increased. This would be doubly unjust, for the onerous character of their existing assessment might put it out of their power to redeem it, and this original hardship would thus be the occasion of placing, them in a position of permanent inferiority. In order to be just to the whole class of landholders, it would be necessary to fix the existing assessment in perpetuity in all parts of India to which the plan of permitting its redemption is extended, and this consideration gives great importance to the proposals of the Government of India.
- 5. The late lamented Colonel Baird Smith argued in favour of a permanent settlement of the land assessment in the North-West Provinces, that it would confirm and accelerate the improvement that had resulted from fixing the assessment for terms of 30 years. That may be admitted, and yet the measure might entail disadvantages which would more than counterbalance these anticipated benefits. It should be shown further that an equivalent prospective revenue to that sacrificed by fixing the present land assessment in perpetuity could be more advantageously obtained

in some other form, for it is indisputable that the cost of governing India will be enhanced as the country advances in wealth and civilization, and that a larger and a larger revenue will be needed, as time moves on, to meet the requirements of a more advanced and complicated state of society. It has to be shown that it would be for the general welfare to give up to the land-holding class, without equivalent, the public right to share in any improvement of the land rent that may and must result from the progress of India in wealth and population. A permanent settlement favours the landholder at the expense of the community at large, and the loss to the future revenue that it involves would have to be met by taxation. All arguments in favour of the measure must rest then upon the assumption that a revenue raised from the rent of land presses more heavily upon the industry of a country than an equivalent revenue raised in other ways. And reasons that would suffice to establish the advantage of a permanent settlement of the land assessment would also suffice to establish the advantage of abolishing it altogether. But how stands the case between rent and taxation? Would India really be benefited if the whole or any portion of the public revenue now derived from the rent of land were to be relinquished, and the amount so given up to be raised by taxation instead? This is the real issue, and a most important one it is.

6. In order to arrive at a clear understanding of this important question, the essential distinctions between rent and taxation must be kept in view. Rent, in the estimation of modern economists, results from land varying in fertility and in advantages of situation, which makes it to be of more value in one place than in another. On the more valuable land a greater amount of produce can be raised for the same outlay than on the less valuable land; but as the latter must suffice to remunerate the occupier, the excess of produce yielded by all kinds of land above that of the worst in cultivation constitutes a rent, which can have no influence in enhancing the cost of cultivation, as this is determined by the cost of cultivating the least favourably situated land, which yields no rent. Rent may therefore be received entirely by a landlord,

or be shared between him and other parties in many different ways, without affecting the cost of agricultural production in the slightest degree. For example, in England the rent of land is burdened with payments of various kinds for local rates, interest of mortgages, and private settlements, which diminish the share left for the landlord; but these burdens do not affect the cost of production at all, which remains exactly what it would have been had the entire rent been received by the landlord.

7. The land assessment of India, when of moderate amount. as in the surveyed districts of the Bombay Presidency, is merely a share of the natural rent that the land must yield when in cultivation, and has therefore no prejudicial influence upon production. And herein consists its distinction from taxation in any form. The latter raises the price of the commodity taxed, and so interferes with its consumption. Taxes upon imports are usually paid by the consumers, and check trade. upon exports are usually paid by the producers, and also check Taxes upon income, necessaries, or personal expenditure, all tend to diminish consumption and check trade. But a public revenue derived from cent neither enhances prices nor diminishes consumption. The whole result is, that the rent is shared between the Government and the ostensible landlord; but the rent itself is neither greater nor less than it would have been had this division not existed, so that the productive power of the country remains unaffected. And as the amount of rent constantly increases with the progress of society, without any effort on the part of the landholder, it may justly be looked upon as the natural inheritance of the public, and forms beyond all question a most legitimate fund for contributing to the expenses of government. Mr. J. S. Mill\* observes most justly, "The ordinary progress of a society which increases in wealth is at all times tending to augment the incomes of landholders, to give them both a greater amount and a greater proportion of the wealth of the community, independently of any trouble or outlay incurred by themselves." In India this continually augmenting income has been at all times

<sup>\* &</sup>quot;Principles of Political Economy," vol. ii. p. 360. Edition of 1848.

prescriptively subject to a deduction for public purposes, or, in other words, a share of the property in the soil has been reserved by the State. And this state of things being universally recognized, the land assessment is the most popular of all imposts, and may from time to time be increased, as the country advances in wealth, without risk of giving rise to serious discontent. A land-holder in India might complain of his assessment being heavier than he could pay, but he never would dream of contesting the right of the Government to increase it within moderate limits. The land assessment is not only the most productive, but also the most popular, of all the modes of raising revenue in India, and it would be a great mistake to imagine that any scheme of general taxation could be devised as a substitute which would be equally acceptable to the people.

It has been argued that, however indisputable the theoretical correctness of the foregoing account of the land assessment of India, the practice of the civilized nations of Europe is against it, and that, as these have advanced in wealth and civilization, they have gradually given up the practice of raising any considerable portion of their revenue from land, and have substituted taxation for the right of the State to a share of the land rent. It would sufficiently account for this, if true, that the governments of Europe have been for the most part in the hands of the landlords; but the assumption that the land of European countries now contributes little to the public revenue will not bear examination. In most of these countries the land tax still forms an important item of the public resources, and is liable to increase without reference to other taxes, and even in England, where the land tax has not varied for upwards of a century, and may be redeemed at an equitable valuation, the land still furnishes the chief resource of local taxation. Tithes and country rates are still in great part paid by the land, and form virtually a charge upon the rent. appears that the assessment on land levied by county rates in England and Wales in the year 1832-33 amounted to 5,434,8901.,\*

<sup>\*</sup> Papers published by the Board of Trade, vol. iii. p. 34, quoted in Maculloch's "Statistical Account of the British Empire," vol. ii. p. 421.

from which it is evident that even here land still contributes largely towards the expenses of administration, and the position that the land assessment has been given up is seen to be untenable.

- There is nothing, then, in the practice of the civilized nations of Europe that is condemnatory of the land assessment of India, or militates against the conclusions to be drawn from a scientific comparison of it with other modes of raising an equivalent revenue. It should be compared with the lately introduced income tax and licences on the exercise of trades and profes. Both of these, in the Bombay Presidency at all events, are most unpopular, and have quite failed to answer the expectations at first formed of their productiveness. It was anticipated that they would add half a million sterling to the revenues of the Bombay Presidency, but the actual yield up to the present time is understood to be less than a fourth of that amount. They are besides liable to the objections of being inquisitorial in their operation, and most demoralizing in their influence upon the revenue establishments and the people at large. It is hardly to be expected that either of these taxes, or both of them combined, would yield in the Bombay Presidency as much as may be expected from the increase of the land revenue that might legitimately be made on the expiration of the thirty years' term for which the existing assessment has been fixed at the survey settlements. The superiority of the land assessment to either of the above sources of revenue can hardly be questioned, and under such circumstances can it be wise or expedient to relinquish for ever the right of the State to participate in a general rise of the land rent. and so to compel a resort to modes of taxation which are hateful to the people and injuriously affect industry, as well as retard the development of the resources of the country?
- 10. It is further worthy of consideration, that future Indian financiers are likely to experience peculiar difficulties in finding substitutes for the gradual increase of the land assessment that is proposed to be given up, through the necessity of their conciliating the public opinion of this country in all their financial arrangements. In this respect the finance of India stands at a great

disadvantage as compared with that of any of the larger colonies of Great Britain. The Finance Minister of an Australian colony or of Canada has only to consider the wishes and interests of his fellow-colonists, and feels himself to be at liberty to tax, and does freely tax, imports from the mother-country, to any extent he may think fit; but the Finance Minister of India must be prepared to encounter a storm of indignation from the manufacturers of this country in attempting to impose import duties upon British manufactures, however much he may deem the measure to be called for with a view only to the interests of India. He will practically be excluded from all sources of income that would injuriously affect the interests of England. At this very time pressure from this country seems about to force the Indian Chancellor of the Exchequer to reduce the duties upon imports by one-half, and an influential party in this country is already agitating for the import and export trade of India being made entirely free. The opium revenue of India is also of doubtful stability, and already opium taxation has been carried to an extreme that leaves little, if any, chance of future increase of revenue from this source. If then the future Indian financier is to be shut out from the prolific resources of the land, customs, and opium, he could only fall back upon direct taxation, with its train of corrupting and demoralizing influences. And it may well be asked, Would a permanent income tax, ever increasing in proportion to the enlarging expenses of administration, be more desirable than periodical enhancements of the land assessment? And if not, how can it be expedient or justifiable, in the peculiar financial relations subsisting betweersthis country and India, to cut away the land from the limited field of taxation open to the financiers of the latter country?

11. There yet remains for consideration the argument that the impetus that would be given to agriculture by the permanent limitation of the land assessment would be so marvellously great that it would more than compensate the Government and the people for the future loss of revenue which the measure would entail. It may be at once conceded that the establishment of the

land assessment in perpetuity would, in some degree, enhance the value of land, and stimulate correspondingly the energies of the landholder. But its effect in this direction would hardly be perceptible in the surveyed districts of the Bombay Presidency, where the assessment has been fixed at a moderate amount for terms of thirty years, accompanied with arrangements for duly recording all changes in the occupation of land, which have made its possession so secure and its transfer so simple, that the energies of the agriculturists have already been stimulated to a most remarkable extent; and it is probable that more has been done for the development of agricultural production than would have been brought about by an entire remission of the land assessment, unaccompanied by a field survey, to define the limits of properties, and to parcel out the waste into fields of a size convenient for tillage, and each bearing a distinct assessment. "The area and assessment of any field, waste or cultivated, in any surveyed portion of the Bombay Presidency, is at once obtainable by application to the village accountant, and any one wishing to cccupy waste, land can thus readily obtain every needful information regarding the portion he is desirous of occupying, and is at once placed in possession, upon engaging to pay regularly the assessment placed upon it. This at once enables a cultivator, who has the means of extending his operations, to suit himself with land, and, combined with the privilege of relinquishing at any time any survey field which he may find it inconvenient to continue to cultivate, places him in a position of freedom and security, in regard to the occupation of land, such as is probably enjoyed by no other agriculturist in the work. And the result has been an extension of cultivation in districts where there was a large extent of waste previous to the survey which is perhaps unexampled.

12. The late Colonel Baird Smith, in his Famine Report, obaserves that, in the surveyed districts of the North-West Provinces, "the latest returns accessible to him show that there is a breadth of culturable and uncultivated land of nearly 8,000,000 acres, being equal to one-third part of its whole present cultivation, and

to about one-sixth part of its total area. Since the existing settlements began a new domain of upwards of 1,000,000 acres has been added to the area of cultivation, and under the additional stimulus of a demand Mmited for ever, it may fairly be expected that the growth of this domain will be sensibly increased." thus appears that about one-eighth part of the culturable waste of the surveyed districts of the North-West Provinces has been brought under tillage since the present revenue assessment was introduced. This is considered to be a satisfactory proof of the success of the settlement, but it is very far short of what has been accomplished in the surveyed districts of the Bombay Presidency under the operation of a field assessment. In the collectorates of the Deccan and Southern Maratha Country, where the proportion of culturable waste to cultivated land, at the introduction of the survey settlements, was about the same as in the North-West Provinces, and where the existing settlements have not upon an average been in operation more than ten years, the cultivation returns would show that a new domain of from two to three millions of acres has been added to the cultivated area under the operation of the field assessment, and that in most of these districts the whole of the waste, excepting soils of very inferior quality, has already been brought under tillage. Instead of one-ninth of the waste, as in the North-West Provinces, at least five-sixths of the waste of those parts of the Bombay territory in which the survey settlements have been in operation ten years and upwards have been added to the cultivated domain. And in the province of Khandeish, where the extent of culturable waste, generally covered with jungle, was six times greater than the cultivated area at the commencement of the survey operations, ten years ago, about half a million of acres has been brought into cultivation. A far greater extension of cultivation than the late Colonel Baird Smith ventured to anticipate, as the result of a permanent settlement of the land assessment of the North-West Provinces, has been already accomplished, under the operation of the field assessment of the Bombay territories, fixed for terms of thirty years. So remarkable and rapid a development of agricultural industry is almost unexampled in any part of the world, without

aid from immigration; and it cannot in fairness be argued that any further stimulus is needed to extend cultivation over the unappropriated waste. And it is nearly certain that no sensible effect in accelerating the cultivation of waste, or the development of the resources of the soil in other ways, would be produced by fixing the present assessment of the settled parts of the Bombay territories in perpetuity. And in all parts suitable for the production of exportable products, such as the Southern Maratha Country and Khandeish, these are promptly raised to meet the wants of the market, as shown by the rapid growth of the export trade of Bombay. The peasantry are becoming comparatively wealthy, independent, and enterprising as evidenced by their conducting the greater part of the carrying trade of the country, in addition to their agricultural operations. and by their raising the New Orleans variety of cotton in localities suited for it, and purchasing costly machinery for cleansing it from the seed. It has been, without due consideration, remarked of other parts of the country, and more especially of the collectorates of Poona, Ahmednuggur, Shalapoor, and Sattara, that the cultivators there continue the old round of grain crops, and do not turn their attention to the raising of valuable products suited for export The observation, however, is most unjust to them, for, with the great populations of Bombay and Poona to feed within easy distance, it so happens that grain crops in the aried climates of those collectorates pay better than cotton or other exportable products, and this is the reason why they are so extensively grown. There, as elsewhere, the ryots raise the crops which they think will pay them best, and they are seldom mistaken in their choice.

13. Property in the soil is just taking root in the surveyed districts of the Bombay Presidency, and the feeling of proprietary right is as surely being fostered and developed under the thirty years' settlements as it would be under a permanent settlement. All that is wanted for this, is security of tenure, moderation in the Government demand, and facilities for transfer, all of which advantages are secured to the occupants of land under the Bombay settlements. The landholders value their possessions more highly than before; but for this very reason, in these purely

agricultural districts, they can rarely be induced to part with them, and in consequence transfers of land are not common. And in parts of the country like Khandeish, where unappropriated waste is readily obtainable on application, it is not to be expected that any considerable price should be given for land already occupied. Owing to these causes, sales of land are comparatively few, and it is probable that many years will yet elapse before any generally recognized understanding as to the saleable value of lane becomes current. Sales have been and are being effected for sums varying from one to many years purchase of the assessment, but they are too few and isolated to be used as data for estimating the saleable value of land in the settled districts. The desire, however, of retaining exclusive possession of laud is universally strong, and is fast consolidating into a proprietary right, which will be fully perfected in the course of time if the present revenue arrangements be upheld. The example of Tanjore, where a moderate assessment, subjected to little change for many years, has so developed private property in the soil, that land sells for twenty years' purchase of the assessment, is also proof that a permanent limitation of the Government demand is nowise essential to the growth of proprietary rights.

14. There still remains for consideration the possibility of a fall taking place in the value of money, which is perhaps the most important circumstance that bears upon the question of fixing the land assessment in perpetuity. A fall in the value of money is equivalent to a corresponding reduction of the existing assessment, and any considerable fall, say to the extent of 25 per cent., would seriously cripple the resources of the Indian Government. It is true that financial pressure from this cause would be in some degree alleviated through certain of the public charges, such as interest of debt, pensions, railway guarantees, &c., being of a fixed character and not liable to increase in proportion to a fall in the value of money; but if it be supposed that the Government would only suffer to the extent of one-half of the diminution in the value of the land assessment caused by such a fall, the consequences, might be very serious. The loss could not be met by

raising the land assessment, for that is to be fixed for ever, and the consequence would be that taxation in some form would have to be resorted to for making it good.

- And this consideration is of especial moment at the present time, when such a fall in the value of money is probably going on throughout the world, owing to the vastly greater quantities of the precious metals that have been produced of late years, and is entirely removed from the region of speculation as regards India, where it has been in sure, rapid, and visible operation for a considerable period. The Indian newspapers and periodicals for years past have teemed with complaints of the increased cost of living. Labourers and servants require more wages; house rent is everywhere higher; horses cost more to keep; and in all departments of private expenditure money no longer goes so far as it did. The same is the case with the great staple of agricultural industry. Grain in Bombay and Poona is much dearer than it was ten to fifteen years ago; cotton is at least 100 per cent. higher (accounted for in part by the stoppage of the Américan supply); oil-seeds and other staples are much enhanced in price. It would be quite within the mark to estimate that prices of agricultural produce are, upon an average, 25 per cent. higher at the present time than they were 15 years ago. And the assessment of the early-settled districts is certainly to that extent lighter than when it was first imposed. This would justify a corresponding increase being made when the current terms of thirty years for which the settlement has been made expire. It is therefore no trifling revenue which the Government of India is now thinking of sacrificing for ever, but an expected increase of 25 per cent. on the land assessment of the Bombay Presidency in the course of the next thirty years. The first of the districts settled was that of Indapoor, which will have been thirty years in operation in four or five years more, and from that time forward one district after ' another would have to be resettled, and the anticipated improvement in the land revenue would begin to be felt.
  - 16. The remarkable fall taking place in the value of money in India is not wholly due to an increased production of the

precious metals throughout the world of late years, but is also ascribable to an increased demand for Indian staples by foreign countries within the same period, which have been purchased to a large extent with silver. The demand of foreign countries for Indian staples has greatly exceeded the demand of India for foreign productions, and the excess of the former over the latter has necessarily been made up by imports of silver, by which the coinage of India has been largely augmented and also lowered in value. There is no indication as yet of any alteration being likely to take place soon in this peculiar condition of the export and import trade of India, so that the depreciation in the value of money, traceable to it, seems likely to continue for some considerable period.

17. The improvement effected of late years in the internal communications of India has also had no inconsiderable influence in lowering the value of money in the interior. Districts which had no easy communication with the coast had of course little foreign trade. Only valuable commodities, capable of ready transportation, could be exported, and consequently their means of supplying themselves with foreign commodities, and especially with silver, were extremely limited. Owing to this cause, the value of money in such, remote localities was always high. of agricultural produce were therefore low, and reductions of the land assessment, by inducing extension of cultivation and increased production, made them still lower, and rendered it more and more difficult for the agriculturist to convert his produce into money. This state of things has been a marked result of the land revenue settlements of the Punjab. But open up such an inland district to foreign commerce by means of railways, roads, or navigable canals or rivers, and silver immediately flows in to purchase the productions which foreigners covet. A greater and greater breadth of the cultivated land, which previously, from the absence of a foreign demand, had been unavoidably devoted to the production of food and other articles suited for internal consumption, is yearly appropriated to the growth of exportable produce, and thus prices rise from two causes-firstly, from a

fall in the value of money caused by increased importations of it; and, secondly, from a diminished production of grain and other crops suitable for internal consumption. It may now be readily seen how great must be the effect of improved communications in raising prices of agricultural produce in inland districts, and so enabling the landholders to pay without difficulty an increased assessment. The enhanced value given to land by improved, means of transport would be a most important subject for investigation when the existing land revenue settlements expire, and the increased assessment that might then be imposed, in consideration of such improvements, would be a certain and most legitimate return to the State for the public money expended upon, or other aid afforded to such undertakings.

- 18. It is also to be borne in mind that a first settlement of the land assessment for a term of years can only be justly viewed as experimental, and experience of its working for a series of years is fequired to ascertain whether it is suitable or not. This remark applies to most of the existing settlements throughout India, exclusive of Bengal, and certainly to all the Revenue Survey Settlements of the Bombay Presidency, none of which have yet run through the thirty years of its first or experimental term, so that even if the principle of fixing the assessment in perpetuity were sound, it would nevertheless be most inexpedient and unwise to give it practical application in the Bombay Presidency until the present settlements have run their course of thirty years and furnished trustworthy data, as well as a fitting opportunity for determining what the permanent assessment should be,
- 19. The foregoing arguments may serve to show the danger of precipitate action in a matter so important as the land revenue of India, even if they should not be deemed conclusive as to the impolicy of fixing the land assessment in perpetuity. They may be shortly recapitulated as follows:—
  - 1. That the great want of Indian agriculture is capital, and it would therefore be most inexpedient to tempt the landholders to withdraw any portion of their inadequate capital from the land in order to redeem its assessment.

- 2. That the land assessment of India, when of moderate amount, is a rent-charge, not a tax, and therefore might be increased when the existing settlements expire in proportion to any rise that may have taken place in the value of land from natural causes, without adding to the cost of agricultural production, or burdening the general industry of the country in any way. This could not be said of taxation in any form, and India therefore could not benefit, but must suffer, by every substitution of taxation for the existing or prospective land assessment.
- 3. That among the civilized nations of Europe the land rent still ranks among the most important sources of the public revenue, and the practice of those nations therefore furnishes no justification for cutting offthis resource from the future Governments of India.
- 4. That it is inexpedient, in the peculiar financial relations of India with England, which allow little freedom of action to the India Governments in dealing with import and export duties, to fetter them still further by depriving them of the power to make the land revenue bear a share of the increased expense of administration that must result from the future progress of India in wealth and population.
- 5. That the impetus likely to be given to agriculture through fixing the land assessment in perpetuity, beyond what is being given by assessments fixed for terms of thirty years, accompanied by provisions for giving security of tenure and facilities of transfer to the landholder, would be too insignificant to form any sufficient compensation to the Government or to the public for drying up a most ancient, popular, and productive source of revenue, and compelling a resort to taxation to make good the loss.
- 6. That the future capability of the land of India to bear assessment must steadily increase as the value of money diminishes, under the combined influence of an increas-

- ing supply of silver, the progress of population and wealth, and improved means of communication; and in proportion to this capability would be the loss to be incurred by fixing the assessment permanently at its present standard.
- 7. That the existing settlements of the land assessments—in the Bombay Presidency at all events—are merely experimental, and are therefore unsuited for being made the basis of a permanent settlement of the land revenue.
- The proposed regulations for the sale of unappropriated uncleared waste land at a price not exceeding 2½ rupees per acre, and of waste unencumbered with jungle at a price not exceeding five rupees an acre, might in certain localities be taken advantage of by Europeans for the formation of tea and coffee plantations; and it is unquestionably most desirable to encourage the formation of such plantations in all suitable localities. And if this important object would be better promoted by the absolute sale of the unappropriated waste, than by its grant at an annual quit-rent for a series of years, the former course should be preferred. the operation of the plan should be carefully confined to localities suited for the settlement of Europeans, and for the formation, under their superintendence, of valuable plantations, by which the export trade and wealth of the country would be augmented, in order that the undeveloped public property in the waste, which must some day become of great value, may not be sacrificed without an adequate object.
- 21. The value of waste land for plantation purposes must, even in suitable climates, vary greatly, according to the nature of the soil, command of labour and of markets, and facilities of communication, and it would often happen that the rates at which the waste is proposed to be sold would be far short of a fair equivalent for the public property in the soil to be transferred to the purchaser. In fact the limitation of rates laid down in the 29th paragraph of the Resolution of the Government of India would afford no protection to the public whatever, as it would not prevent a local officer from assigning away the land for ever for a merely nominal

- price. The limitation could only operate against the public, never for its protection; and as it would invest the local authorities with great discretionary power which could hardly be used in the interests of the public, it seems most desirable that any limitation should declare the minimum, not the maximum, price at which the unappropriated waste may be sold. A better test of the value of the public property which is proposed to be sold would be to put it up to auction at a minimum price, though this plan also is liable to objection as being likely to discourage settlement, for it would be a great disappointment to any intending planter, after having discovered, by laborious and possibly expensive investigation, a suitable locality for his plantation, to lose it after all by some one bidding over his head. This difficulty would be obviated by allowing the planter to obtain his land without resorting to an auction sale, on condition of his paying an annual quit-rent to Government, amounting to 5 per cent. of the minimum price of which it would be put up to auction, for thirty years, when the quitrent should be subject to revision and increased, as in the case of the survey settlements of the North-Western Provinces and Bombay. It would probably be found that most planters would prefer to hold at an annual quit-rent, so as to be able to reserve all their capital for the cultivation of their estates, while by this plan the public property in the prospective land rent would be preserved intact, and at all events no harm could be done by giving the planters the option of resorting to either of the two modes sug gested for obtaining the land they may require.
- 22. It would be most undesirable, however, to extend the rules for the purchase of waste lands to localities unsuited for Excopean planters, as this would, as already explained, be equivalent to fixing the land assessment in perpetuity, and so deprive the Government and the public of a most promising source of future revenue. The whole Presidency of Bombay (exclusive of Sind) does not perhaps contain a single tract of waste land from which a European could make a living as an agriculturist. Its principal wastes are in the province of Khandcish, and they are for most part of the year pestilential jungles in which a European could

not live. There is no public advantage to be gained in the Bombay Presidency by the introduction of rules framed to meet the requirements of European planters, and it is most certain that these would not avail themselves of them; whereas the existing system is found to be quite suitable for Natives, and is ensuring a more rapid cultivation of the waste than the most successful of British colonies can parallel, while it secures to the public their unquestioned right to share in the future increased value that cannot fail to be given to the lands in question, through the operation of the natural causes which have been already fully described in discussing the policy of fixing the land assessment in perpetuity. The value of the public property in the wastes of Khandeish is enormous. This province, before it was wasted and its population almost exterminated, by repeated inroads of Maratha and Pindarree hordes of plunderers, yielded a public revenue of three-fourths of a million sterling, and so rapid is likely to be its progress under the survey settlement, now that it is brought into direct railway communication with Bombay, that its land revenue may well be doubled in the course of the next thirty years by the cultivation of waste, when that doubled revenue would admit of being further increased on the renewal of the survey settlements. There are extensive tracts of waste in Khandeish which, from the absence of population, are not yet in a condition for detailed survey and assessment, but it would be a monstrous sacrifice of public property to declare these wastes to be saleable for any sums not exceeding 2½ rupees per acre. The Khandeish husbandmen have added half a million of acres to their cultivated domain in the course of the last ten years, and are steadily advancing upon the jungles around them at a continually accelerating pace. The next ten years may possibly add a million mere of acres to their conquest from the jungle, and, as population and wealth increase, their encroachment upon the waste will continue until the whole five millions of acres, at which its extent may be roughly estimated, are brought under their dominion. now going on under the operation of field settlements fixed for thirty years, and it may be asked what more remarkable or satisfactory progress could be desired? The future public property

in course of development in the province of Khandeish is enormous, and it would be a grievous error and public misfortune were it to be sacrificed, eitheir by fixing the present land assessment in perpetuity, or by selling the unappropriated waste upon the terms proposed.

23. The proposals of the Government of India for the sale of waste lands in perpetuity, discharged from all prospective demand on account of Land. Revenue, may then be pronounced to be quite unsuitable for the Presidency of Bombay, which never has offered, and never will offer, a field for European planters. Europeans may, and it is to be hoped will, locate themselves in the interior, to purchase and prepare cotton and other agricultural products for foreign markets, and their presence there would in all probability be of great advantage to the landholders and to the foreign trade of the Presidency. But as mere agriculturists there is positively no opening for them at all, and the object of encouraging their settlement as planters is too visionary to furnish a shadow of an argument for disturbing a successful land settlement which is securing a rapid extension of cultivation over the waste, while preserving intact the public rights over the undeveloped capabilities of the soil, as the patrimony of future generations.

G. WINGATE.

Crofton House, Hants, 2nd May 1862.

Revenue Survey and Assessment,

No. 1211.

REVENUE DEPARTMENT.

Bombay Castle, 27th March 1868.

Memorandum from the Survey and Settlement Commissioner N. D. No. 8321, dated 30th October 1867—Forwarding 16 printed copies of Sir George Wingate's Notes upon his (Colonel Francis') report No. 147, dated 12th February 1867, on the re-settlement of the Indapoor Talooka, and of his letter No. 828, dated 7th October 1867, handing up the same to Government; as also 10 copies, with maps, of the Report above referred to.

Resolution.—The original Report of Colonel Francis containing his proposals for the revision of the settlement of Indapoor was submitted by the Revenue Commissioner S. D. with a memorandum dated 22nd May 1867. This Report gives a very clear account of the circumstances of the Talooka before it was surveyed and settled by the late Mr. Goldsmid and Sir George Wingate, and also of the results of the settlement, which are shown to have been most satisfactory. A copy was at once forwarded to Her Majesty's Secretary of State, but as this is the first of the series now commencing of the revised settlements in the Deccan and Southern Maratha Country, the subject is of unusual importance, and final instructions on the Report were deferred until Colonel Francis should have had an opportunity of consulting Sir George Wingate in England.

- 2. This has been done, and Colonel Francis has forwarded a memorandum which Sir George Wingate has drawn up. It is most satisfactory to find that the conclusions arrived at in this memorandum correspond so very closely with the proposals which Colonel Francis submitted to Government.
- 3. Sir George Wingate's suggestions in regard to the more accurate and uniform record of Survey statistics should be attended to. The proposals in Colonel Francis' 4th paragraph founded

thereon should be adopted, with the modification that the Survey Commissioners should consult the Revene Commissioners before finally submitting the forms for the approval of Government, and should either obtain their consent or explain the reasons of their dissent in any particulars.

- 4. There can be no doubt but that the local cess should be fixed for the period of settlement, as stated in paragraph 7 of Colonel Francis' memorandum, and the rate of one anna may be adopted as proposed. It will of course be made clear that the right of Government is reserved to impose water rates in the event of irrigational works being constructed.
- 5. Ordinarily it will not be needful to re-measure and reclassify whole districts as they come under re-settlement; but in districts surveyed during the early years of a newly organized survey these operations must be repeated, and the visdom of the course adopted by Government and the Legislature in reserving the right has been already proved by the admitted necessity for a new measurement and classification of the district of Indapoor.
- 6. There is a great deal of force in what Sir George Wingate urges in his 6th to 9th paragraphs about the taxation of improvements. But Government cannot fully coincide in all his conclusions.
- 7. In regard to special taxation of wells, it is said with truth that water is, like mineral wealth, fairly taxable by the landlord when used by the tenant. His Excellency in Council, however, considers that the first principle of its taxation should be that which governs our taxation of the land itself; that is, the capability of being used rather than the use itself. If water of good quality be easily available near the surface, it is more reasonable to tax such land by a light additional rate, whether the water be used or not, than to lay an oppressively heavy tax on those who expend capital and labour in bringing the water into use. There is, however, a point at which this principle must be modified, for when the land is such that when water is not brought to it it will bear nothing, and when water is used it will yield a fine crop, then even a light tax in the former case is impossible. Of this class

are the sandy tracts in the Conçan, which under the influence of water become cocoanut gardens. It must be held that the right of Government to levy a rate by virtue of the water below the surface is in abeyance, or dormant, till the water is produced, but it is doubted greatly, even in this extreme case, whether it is politic, though it may be asserted to be just, to levy more than would be leviable from first class rice ground, which enjoys also the benefits of water, not created, it is true, by the tenant, but utilized by means of his preparation of the ground.

- 8. The question of rice fields as compared with dry crop land next naturally arises. The Governor in Council is not prepared at present to concur wholly with Sir George Wingate; for it may be asked whether the adaptability of the soil to rice crops is not sufficiently taken into account if the land when so adapted is treated as first class dry crop land, without adding a special rate because the tenant has expended capital in developing its qualities.
- 9. But, as stated by Sir George Wingate, this question does not arise here, and it may be reserved for future discussion.
- And in respect to garden lands it is true that in some districts the difficulty of ascertaining what lands have water capabilities may prevent the adoption of a system that, in lieu of taxing wells specially, taxes all lands capable of producing water with a reasonable amount of trouble. Still Government would advocate the propriety of restricting the demand of Government on well lands to the maximum rate on first class dry crop soils. extra rate for water capabilities in all districts in which such capabilities may be easily ascertained and recorded might properly be added to the classification, just as a double crop, or other special fertility, is dealt with. But this may not be practicable or expedient everywhere, and in all districts, such as that of Indapoor, in which the garden cultivation is scanty—and it is a great object to encourage it—the best policy is that which Colonel Francis has adopted. It may be difficult to ascertain what lands are capable of producing water, but it is easy to make the maximum for dry crop lands the maximum for well lands also. This course, which His

Excellency the Governor in Council sanctions in the district now under review, will certainly lead to the great increase of well cultivation during the currency of the settlement now about to be made.

- 11. In regard to Sir George Wingate's remarks in paragraph 9 about a building rate, it may be observed that the Survey Act hardly provides in sufficient detail for the contingency of the increased value of property for building purposes; and it is probable that special legislation will have before long to be resorted to in order to obtain proper sanction for the rules under which the settlement of such lands is now progressing in the larger towns.
- Sir George Wingate has in his memorandum referred briefly to his views of a permanent settlement. Government consider that his arguments against permanent settlements are thoroughly conclusive, and the present settlement of Indapoor may be taken as an example, on the one hand, of the prosperity attainable under a thiry years' settlement, and on the other of the wasteful sacrifice of revenue involved in a permanent settlement, for had the former settlement been permanent, Government would now have been deprived of an additional revenue of 53 per cent., which the people are ready to pay without the slightest dissatisfaction. If it be alleged that the memorandum written on this subject by Sir George Wingate some years ago is out of date, his remarks in the present memorandum are at any rate fresh and well timed, and they give Government the most recent views of one who has greater experience in the Revenue system of this Presidency than any one alive.
- 13. The very elaborate details by which Colonel Francis has supported his propositions for the revision of the rates leave no doubt but that he has exercised a very wise discretion in not increasing the assessment further, as he might have done had he been guided solely by the recent prices of produce.
- 14. An increase of upwards of 50 per cent. is not slight, but it is fully justified by the difference in the circumstances of the district, the increased facilities of communication, and the rise in prices, even taking the average prices much lower than those ruling in the last five years.

- 15. The Governor in Council therefore confirms the proposed rates for thirty years, and approves, subject to the above remarks, all Colonel Francis' proposals now submitted in these reports.
- The acknowledgments of Government are due to 16. Colonel Francis for his very clear and elaborate Report.
- A copy should be sent to Her Majesty's Secretary of State.

To the Revenue Commissioner N.D., REVENUE COMMISSIONER S.D., SURVEY & SETTLEMENT COMMISSIONER S.D., on which the Resolution is passed.

Bombay Castle, 4th April 1868.

TO HER MAJESTY'S PRINCIPAL SECRETARY of STATE for India in Council, London.

RIGHT HONOURABLE SIR,

With reference to your despatch No. 59, dated the 14th

Letter from Lieutenant Colonel Francis, Survey and Settlement Commissioner, No. 828, dated 7th October 1867.

Memorandum by Sir George Wingate, referred to

in paragraph 1 of the above.

Memorandum referred to in Colonel Francis' paragraph 8, and Sir George Wingate's paragraph 15.

Government Resolution No. 1211, dated 27th March 1868.

September last, we have the honour to forward to you the accompanying copy of the papers as per margin, relative to the revision of the Assessment of the Indapoor Talooka of the Poona Collectorate.

We have the honour to be,

Right Honourable Sir,
Your most obedient, humble Servants,

W. R. SEYMOUR V. FITZGERALD.

B. H. ELLIS.

S. MANSFIELD.

#### REVENUE DEPARTMENT.

From the Acting Settlement Officer,
Right Bank Districts,

To the Collector of Shikarpoor.

Settlement Office, Kotree, 11th October 1867.

Sin,—I have the honour herewith to forward a statement of the results of the Settlement rates introduced into 53 villages of the Kukkur Talooka.

- 2. I anticipated considerable difficulty in effecting a satisfactory settlement of these villages, owing to their having been visited by frequent floods, from breaches in the Narra and from the river, during the past ten years.
- 3. As will be seen from the results in the accompanying statement (A), the people of 46 villages took up their land with great readiness; 7 villages, lying on the western bank of the Narra, entered into a combination to refuse the Settlement rates, hoping thereby to force Government to permit a continuance of the former system, namely, yearly measurements, by which the cultivator paid only for such an area as he brought under the plough.
- 4. The cultivators in these seven villages refused to take up a single acre of their land, and up to the date on which, having completed the Jummabundy of the other villages, I left Kukkur, they persevered in their refusal.
- 5. Hearing indirectly that they were feeling uneasy lest their obstinacy should produce results very contrary to their expectations, I left the papers necessary to carry out the Jummabundy of these

seven villages with Mr. H. G. Watson, Deputy Collector of Mehur, who had assisted me greatly in the Jummabundy of the other villages, and who was well acquainted with the system to be introduced.

- 6. After the lapse of some time the zemindars came forward and took up a portion of their land, details of which will be shown separately.
- 7. At the time of Jummabundy the cultivators complained of the loss they would sustain were they compelled to take up the numbers which were then lying under water, having been flooded from the breaches made in the Narra during the preceding inundation season; they also represented that if they refused to take these numbers they would, by the terms of the proclamation issued last February, lose all right and title to them.
- 8. The case appearing to me to be one worthy of consideration, I made it known that, subject to the confirmation of the Commissioner in Sind, all numbers submerged at the time of Jummaburdy need not be taken up by the owners until they were free from water and in a culturable state; and consequently I have had a separate column in the statement accompanying this Report for numbers of this description. I trust that the Commissioner will sanction the measures taken by me, as the cultivators have suffered very greatly from the effects of these floods for many years past, and appear to me to have a claim on the indulgence of Government in this matter.
- 9. Some of the numbers thus submerged have been taken up by the owners, in the hope of making a profit from the fish and letus roots which are to be found in them. No opposition was made to their so doing, as the numbers being assessed under the Settlement, and the presence of the water in such quantity being an accident not likely to happen again, I considered that the owners were entitled to the benefit, if there were any.
- 10. The Jummabundy of 46 villages out of 53 were completed by me, the results of which are subjoined:—

Area brought under Settlement, onot including waste.

Jumma fixed by Settlement.

including waste.	,

•			

- 11. In addition to the above area, which is land cultivated within the last five years, there are 1,780 acres 35 goontas of land which had formerly been cultivated, but not within the last five years. This area was assessed at Rs. 1,451-15-0, and 1,309 acres 10 goontas, assessed at Rs. 969-13-0, were taken up, thus making a total area of 23,633 acres 10 goontas and an assessment of Rs. 36,629-13-0.
- 12. These results were beyond my expectations, as I was well aware of the state of the district, and I had been informed that the people felt averse to any change from the old system, which, as it rendered them liable to assessment only on the actual area brought under cultivation, relieved them from the responsibility of their entire holdings.
- 13. The Jummabundy of the seven villages on the western bank of the Narra was not so satisfactory. The large area of their

<sup>\*</sup> Being 95.7 per cent. of the whole.

land under water, 2,027 acres 5 goon as out of 7,422 acres, very probably discouraged them, but when they had made up their minds to follow the example of their neighbours it is strange that they should have left so much land to its fate.

- 14. The area of these villages brought under the Settlement is 7,422 acres, the assessment on which is Rs. 11,381-8-0. After deducting 2,442 acres 15 goontas and Rs. 4,734-12-0 on account of land which was submerged and of which the owners were absent at the time of Jummabundy, we find that the area taken up by the cultivators is only 2,163 acres 8 goontas and Rs. 2,084-12-0, or only 61-5 per cent.
- 15. The cultivators of Bhungur, Guchul, and Wah Sobdar have thrown up nearly the whole of their land, and I attribute this course on their part to the influence of Mahomed Khan Bhooira, the zemindar of Deh Bhungur, who took a prominent part in the combination at the Jummabundy I carried out before leaving the districts.
- 16. As stated in paragraph 13, it is difficult to assign a reason for such conduct on their part. It certainly is not from the fact that they were over-assessed, as a glance at the area under cultivation in past years and that assessed by the Settlement shows a considerable increase in the latter, so as to bring the rate per acre much lower than that they usually paid; any uncertainty in their water supply was thereby fully compensated.
- 17. The villages of Pejaho, Bahadurpoor, Chowbar, and Bego Dero have, on the other hand, taken up every acre which was not under water or of which the owners were not absent, thus rendering the conduct of the other villages still more remarkable, as the risks attendant on cultivation in the latter are not so great as those in the former.
- 18. The total area taken up in the 53 villages which were brought under the Settlement is 25,743 acres 38 goontas and Rs. 40,720-9-0, and that thrown up is 4,125 acres 15 goontas and Rs. 4,153-13-0.

- 19. A statement, marked A, is appended to this Report, showing in detail those numbers which have hitherto been held under lease, and which are assessed by the Settlement at a higher rate than that which they are obliged to pay according to the terms of the lease. The difference is Rs. 24-5-6 on seven numbers. Until the expiry of the lease the holders will continue to pay at the lower rates.
- 20. The names of zemindars holding grants of "Seree," with the extent of their grants, and the Survey numbers in which they are situated, are given in Statement B: as none of the Seree grants correspond exactly in area with any Survey number held by the grantees, the assessment of the number from which they wish the Seree to be deducted will be diminished by that amount so long as that number is held by the said grantee.
- 21. In the villages of Guchul and Chowbar the zemindars to whom the Serce was granted have not taken up any of their land. In the case of Guchul I would recommend that the Serce be resumed by Government, as this zemindar is one of those who have combined together to throw up their land in toto; but the land of the Chowbar zemindar is under water, and I think it only fair that if he takes up his land during the ensuing cold weather he should be allowed his Serce.
- 22. There are only 80% acres of Seree grants in these 53 villages.
- 23. I wish to point out the services rendered by the zemindars of the three villages mentioned below, in persuading the rest, when they were in a state of indecision to take up their land; had they not, both by example and precept, induced confidence in Government, I feel certain that the intrigues set on foot by the zemindars of Bhungur, Bahadurpoor, and the other villages before alluded to by me, would have gone far to defeat the successful introduction of the Settlement. I therefore beg to recommend that the good conduct of these zemindars may be rewarded by a grant of Seree, as specified opposite their names:—

Name of Village.	Name of Zemindar.	Amount of Seree already granted.	Amount now proposed.
Ludda Gadai	Wudhia, son of Sob- dar Gadhaec.	None.	5 acres.
Kheenro	Allahdad, son of Hy- atkhan Purrio.	l acre 20 geontas.	5 acres.
Khat Kolachee	Mahomed Alli, son of Mirza Kolachee.	None.	5 acres.

- 24. By this recognition of their services in forwarding the introduction of the Settlement an excellent effect will be produced, and the feeling of distrust and dislike which I have found to exist very generally against this department will disappear, when it is found that Government is disposed to reward those who assist it.
- 25. In the village of Kukkur a Survey number (127) of I acre 15 goontas is held by a fakeer named Nango Shah, son of Beero Shah, who has planted a few trees, some for shade and others for their fruit, and which he irrigates by means of water drawn from the Narra with earthen pots. He has put up a rough shed, under the shade of a large peepul tree, which is kept swept and sprinkled, so as to form a cool shelter for passengers who cross at the ferry close to this number. The fruit, I learn from the Mooktyarkar of Kukkur, is free to any one who chooses to pluck it.
- 26. In a climate like Sind it is very desirable that every encouragement be given to men who are willing to spend their time in pursuits which are so beneficial to the public, and are also harmless in themselves.
- 27. As, therefore, this fakeer has a good character, I would recommend that the assessment on this number, amounting to Rs. 2-8-0, be remitted during the life of the present owner, on condition of his continuing to maintain the garden for the use of the public, and that he does not allow it to become a refuge for the idle and dissolute.

- 28. The village maps and registers of these 53 villages, three copies of each, have been made over to your department.
- 29. In each register is included a statement of all numbers on which Government water rate is to be levied. The column for the entry of the amount is left blank, but when you determine the rate at which water rate is to be levied it will be easy to fill it in.

I have the honour to be,

Sir,

Your most obedient Servant.

R. R. WALLACE, Major, Acting Settlement Officer, Right Bank Districts.

R. WALLACE, Major, Acting Settlement Officer, Right Bank Districts.

### • No. 2761 of 1867.

REVENUE DEPARTMENT.

From the Acting Collector of Shikaregor,

To the Commissioner in Sind. .

Collector's Office, Shikarpoor, 4th November 1867.

Sir,—I have the honour to forward herewith in original Major Wallace's Report, regarding the introduction of the Settlement rates into 53 villages of the Kukkur Talooka.

- 2. On the whole the results of the Settlement are satisfactory, which I attribuse to the great pains and care taken by Major Wallace, whose knowledge of the people, and judicious mode of treatment in all real cases of grievance brought to his notice, is remarkable.
- 3. I am glad to state that the present year's inundation has been favourable; the Narra has been kept within bounds; and the greater part, if not the whole, of the flooded land mentioned in the Settlement Officer's Report is free of water, or will be so shortly.
- 4. As this year the banks of the Narra will be repaired, and masonry sluices erected at the mouths of all canals, there is but slight probability of any further disastrous flooding in years to come, which if it does occur can be dealt with as a special case.
- 5. I would therefore recommend that the zemindars on the western bank of the Narra, a great part of whose land was flooded at the time of Jummabundy, be allowed to the 31st of March next to take up their numbers, failing to do which I would enforce the Act in its integrity against them: this I would apply also to the lands, mentioned in paragraphs 7 and 8 of Major Wallace's Report.
- 6.- In reference to paragraph 21 of the Settlement Officer's Report, I have directed the Deputy Collector of Mehur to resume the Seree in the Dehs Guchul and Chowbar, as the numbers in which the grants are situated have been thrown up. In the latter Deh I beg

to be allowed to re-grant the same, should the zemindar take up the number prior to the 31st of March next.

- 7. I beg most strongly to recommend the grants to the three zemindars mentioned in paragraph 23 of Major Wallace's Report, as I am of opinion such an indulgence will have a most beneficial effect in future Settlement operations.
- 8. The small yearly remissions recommended in paragraphs 25, 26 and 27 I also approve of, and request your sanction thereto.
- 9. I purpose fixing, with your approval, the water rate at six annas per acre, the same as is now paid throughout the district.\*
- '10. In conclusion I am glad to bring to your notice the cordial way in which Mr. Watson cooperated in the introduction of the Settlement into his district, which tended greatly to its success.

I have the honour to be,

Sir,

Your most obedient Servant,

W. A. GHLESPIE, Captain, Acting Collector of Shikarpoor.

<sup>\*</sup> This para, was subsequently modified in the Commissioner's Office as below, as per Collector's letter No. 3095, dated 6th December 1867:—

<sup>&</sup>quot;I purpose fixing, with your approval, the water rate at (2) two annas per rupee of assessment, as now fixed for the settled dehs in the Rorce Talooka."

## No. 2656° or 1857.

REVENUE DEPARTMENT.

Commissioner's Office, Hydrabad, 26th November 1867.

Forwarded to the Survey and Settlement Commissioner for Sind for the favour of his opinion.

W. H. HAVELOCK, Acting Commissioner in Sind.

#### No. 1036 of 1867. •

Camp, Callian, 20th December 1867.

The Report shows that in 46 out of the 53 villages included under the Settlement Officer's proposals ninety-five per cent. of the assessed land was taken up at the Jummabundy. The zemindars of the other seven villages refused at first to take up any land whatever; they afterwards changed their minds, and up to the date to which the Report extends had entered into agreements for the cultivation of 61 per cent. of the assessed area of their villages.

- 2. Major Wallace has dwelt at considerable length upon the conduct of the zemindars of the villages last alluded to refusing to have anything to say to the Settlement. In cases of combined opposition of this kind the only point for consideration is whether there is any reason to doubt the fairness of the rates imposed. We have a satisfactory answer to this in the fact of the same rates being most popular in adjoining villages, and that the opposition was factious in the first instance is proved by the subsequent acceptance of the Settlement for great part of the lands of the villages concerned.
- 3. The area which has not been taken up is composed chiefly of flooded lands, not at present in a culturable state. The zemin-

dars' objections to take up such lands are not unreasonable, and

Major Wallace displayed good judgment in
conceding to them the option of not taking
them up "until they are free from water and in a culturable state."

- 4. The Collector proposes to give the zemindars till the 31st of March only to reflect whether they will take up these flooded lands, and in case of failing to do so would then extinguish their right. It appears, however, to the Survey Commissioner that it is advisable to treat a case like this with more consideration, and to allow the lands to remain free of rent charge, and with the zemindars' right reserved, until reported by a regular inspection (to be made by the district establishment) to be in a culturable state.
- 5. The questions regarding Scree grants are matters of detail affecting the general revenue administration of the district, upon which the Survey Commissioner does not feel himself called upon to express an opinion.
- 6. There seems to be no objection to the fakeer being allowed a remission of the assessment upon the small garden alluded to, provided it is kept open to the public as a resting-place for people crossing the ferry.
- 7. The Collector proposes to fix the Huccaba rate for this district at six annas per acce. But as the plan of calculating this rate upon the assessment has been generally introduced—two annas per rupec being the amount usually set apart for the purpose—the same course might be followed in this case. The Settlement Officer should therefore be requested to adopt this plan, entering the amount in the village register in the manner followed in the other Survey Departments.
- 8. In conclusion Lieutenant Colonel Francis begs to state that he considers the results of the Settlement to be very satisfactory. Great credit, in his opinion, is due to Major Wallace, not only for the manner in which he has fixed the rates, but for the judgment displayed in his treatment of the zemindars of the district.

J. FRANCIS, Lieut. Colonel, Survey and Settlement Commissioner, N.D.

## No. 124 of 1867.

REVENUÉ DEPARTMENT.

From the Settlement Officer, Right Bank Districts,

To the Commissioner in Sind.

Settlement Office, Kotree, 10th December 1867.

Sin,—I have the honour to request sanction for a temporary Huccaba rate of two annas in the rupee for the Kukkur Talooka of the Shikarpoor Collectorate.

- 2. No site was proposed by Major Wallace in his Settlement Report for this district, and no permanent rate can be fixed till other talookas watered by the same canals have been settled.
- 3. The Survey Commissioner has approved the proposed temporary rate, in his latter to me No. 972 of the 3rd instant, extract from which is appended, and the Collector has suggested two annas in the rupee as a suitable rate, in some Sindhee correspondence on the subject.

I have the honour to be,

Sir,

Your most obedient Servant,

M. R. HAIG, Major,
Settlement Officer, R. B. D.

Extract of a letter from the Survey and Settlement Commissioner to the address of the Settlement Officer, Right Bank Survey, No. 972, dated 3rd December 1867.

I have the honour to acknowledge the receipt of your letter of the 27th ultimo, No. 113, relative to the Huccaba rate to be levied in the settled villages of Kukkur Talooka, and in reply beg to intimate that I approve of your suggestion to levy a rate of two annas per rupee of assessment as a temporary measure, pending the settlement of the other talookas which derive their water supply from the same canals as the Kukkur Talooka.

M. R. HAIG, Major, Settlement Officer, R. B. D.

(True copy)
H. ROZARE,

'Assistant Commissioner in Sind.

No. 679 of 1868.

BEVENUE DEPARTMENT.

Commissioner's Office, Kurrachee, 2nd April 1868.

Submitted for the sanction of Government.

2. Considering the recent disasters by flood in the Kukkur District, to avert which, however, effectual measures, instituted by the late Commissioner, have since been carried out, the result of this Settlement cannot be regarded as otherwise than satisfactory. In submitting the Settlement papers for six tuppas in the Kukkur Talooka with his No. 1085 dated the 9th of May 1867, Mr. Mansfield placed on record his opinion that the Survey and Settlement should not have been introduced into this talooka until the floods had been controlled. It is satisfactory to learn, from the 3rd paragraph of the Collector's forwarding letter, that an improvement has taken place in this respect during the year 1867-68, and from paragraph 4 that the banks of the Narra would be repaired, and masonry sluices erected at the mouths of all the canals.

- 3. When the recusant zemindars of the seven villages lying on the western bank of the Narra perceive the improvement which has taken place, and which it is hoped will continue, they will, no doubt, gladly take up the numbers which they have thrown up on account of the flood. The Commissioner agrees with Colonel Francis in thinking that Major Wallace displayed good judgment in conceding to these zemindars the option of not taking up land until it is free from water and in a culturable state.
- 4. The result of the Settlement as shown in Major Wallace's 18th paragraph is—

Acres.	G.	Rs.	a.	p.
25,743	38 taken upRevenue	40,720	9	0
4,125	15 not taken upRevenue	4,153	13	0

- 5. The subjects alluded to in paragraphs 21 and 23 will be considered departmentally.
- 6. The small number (127,—1, acre 15 goontas) assessed at Rs. 2-8-0 may be continued free to the fakeer on condition that he continues to shelter passengers crossing the ferry.
- 7. The Collector will be directed to calcutate Huccaba at the rate of two annas per rupee, as recommended by the Survey Commissioner and Settlement Officer, and concurred in by the Collector in a late communication.
- 8 The one anna cess for Local Funds has been included in the Survey Settlement papers, and will be imposed under Act VIII. of 1865.
- 9. The Commissioner concurs in the commendation bestowed on Major Wallace by the Survey and Settlement Commissioner.
- 10. It is requested that fifteen copies of the correspondence may be furnished as soon as it is printed.

W. H. HAVELOCK, Commissioner in Sind.

## Revenue Survey and Assessment.

#### No. 2077.

#### REVENUE DEPARTMENT.

## Bombay Castle, 27th May 1868.

Memorandum from the Commissioner in Sind, No. 679, dated 2nd April 1868—Submitting for sanction a letter from the Collector of Shikarpoor, with its accompanying Report by the Settlement Officer, Right Bank Districts, relative to the result of the Settlement rates introduced into 53 villages of the Kukkur Talooka of that collectorate, together with a memorandum from the Survey and Settlement Commissioner N. D., containing his opinion regarding the above Settlement.

RESOLUTION.—The Settlement appears to have been-carried on under some difficulty, owing to the recent disasters by flood in the Kukkur District.

2. In 46 out of the 53 villages included under the Settlement Officer's proposals, 95 per cent. of the assessed land was taken up at the Jummabundy, and the zemindars of the remaining 7 villages have since entered into agreement for the cultivation of 61 per cent. of the assessed area of their villages. The area which has not been taken, it is reported, is chiefly composed of flooded lands not in a 'turable state.

His Excellency in Council approves of the zemindars being be option of not taking up the inundated land until free and in a culturable state.

It of the Settlement in the 53 villages is reported to

38 taken up; Revenue Rs. 40,720-9-0.

overnor in Council views this result

'the mindars refuse at present to the revenue therefrom

- Rs. 4,1,53-13-0. Government concur in the opinion expressed in Coloniel Francis' 4th paragraph, that this land should be allowed to remain free of rent charge, and with the zemindars' rights reserved, until reported, after a regular inspection (to be made by the district' establishment), to be in a culturable state.
- 7. His Excellency in Council sanctions the small area of land measuring 1 acre and 15 goontas, and assessed at Rs. 2-8-0, being continued free to the fakeer who holds it, on condition that it is kept open to the public as a resting-place for people crossing the ferry.
- 8. The instructions which have been issued for calculating the. Huccaba at the rate of two annas per rupee are approved.
- 9. His Excellency in Council concurs in the commendation bestowed on Major Wallace by Colonel Francis and the Commissioner.
- 10. The whole correspondence should be printed as a Selection from the Government Records.

M. J. SHAW STEWART, Acting Chief Secretary to Government.
